

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

**THE AUTHOR.**

## TRANSLATOR'S PREFACE.

THE well-established reputation of Tennemann's *Grundriss der Geschichte der Philosophie*<sup>a</sup>, may absolve its translator from any longer preface than is necessary to explain the principles by which he has been guided in the prosecution of his undertaking.

In consequence of the extreme conciseness, in places, and the pregnant brevity of the original, I have been sometimes obliged to employ expressions of my own to convey the sense of my author; which would have been misrepresented by a literal version. Occasionally this has been made necessary by the phraseology of Tennemann, borrowed from the school of Kant to which he belonged; and which if presented to the English reader in all its native peculiarity might have been understood by none but those who were the least likely to consult the translation. As far, however, as it appeared possible, I have preserved the technical expressions of my author, subjoining for the most part an explanation of their meaning for the benefit of those English readers who may not have plunged into the profound abyss of German metaphysics. As a Manual of the present description ought to be calculated for general use, I have in general made

<sup>a</sup> I have entitled the present work a *Manual* of the History of Philosophy, in preference to a literal translation of the German title, for the same reasons which probably led the French translator (M. Cousin), to a similar choice. It is needless to remark, that the original is an abridgment, by Tennemann himself, of his History of Philosophy, in eleven volumes, and was first published by him in 1812; since which time it has been frequently reprinted, with considerable improvements and additions, principally from the pen of professor Wendt, of Göttingen. The present translation has been made from the Leipsic edition of 1829.

The term *Philosophy*, it will be observed, implies throughout *Moral Philosophy*, or *Metaphysics* in general.

it my object to remove from my work all those peculiarities which would have had the effect of embarrassing without instructing the private student, and whenever it has appeared to me that an observation of my author was of a nature impossible to be apprehended by any but a scholar long familiar with the disputes of the German lecture rooms, I have endeavoured to express the sense of it in other words, or, in a very few instances, have preferred to omit it altogether. It is hoped that every thing which is really valuable in the original, on many accounts so admirable, will be found to have been retained. If it be thought that in some instances I have departed too far from the expressions of my author, let it be remembered that the most *literal* is not always the most *faithful* translator; and that he who shall render *verbum verbo* the composition of a German metaphysician or historian, runs the risk of being intelligible only by a reference to his author, or by having his own work *done into English*. There are parts of Tennemann which on this account I had much rather have composed anew than translated, particularly the Introduction.

The history of German metaphysicians subsequent to Bardili, I have found it necessary to abbreviate more considerably. The articles alluded to were principally compiled by M. Wendt, in order to supply what Tennemann did not live to complete—an account of the living philosophers of his own country: but these sketches are so extremely concise and the language so technical that, (added to the unspeakable absurdity of many of the systems reviewed), it would have been impossible to have made them intelligible to an English reader without enlarging them to a disproportionate extent. M. Cousin who felt the same difficulty has, in his translation, omitted them altogether; preserving however the catalogues of each author's works. I have preferred giving, for the most part in the author's words, some general idea of each system, and have preserved as much of the bibliographical part as appeared in any degree necessary for the uses of the English reader. Another reason seems to have

contributed to induce M. Cousin to suppress these articles, namely, that the metaphysicians in question are so perpetually in the habit of changing and modifying their views, that before a statement of their sentiments could have been printed at Paris or Oxford, they may very probably have displaced every fragment of their own theories, and promulgated a new set of opinions to their pupils of Jena or Göttingen.

For similar reasons I have slightly modified the concluding articles on the present philosophical systems of other countries; preserving, however, all the information they contain.

It must be borne in mind that Tennemann was a German and a Kantist, with all the erudition which characterises his learned countrymen, and with a much larger proportion of judgment and discrimination than they are sometimes found to evince. Still, his criticisms are necessarily cast in the mould of his school; and although greatly too well informed and too acute to be a slave to its prejudices, he is apt to be encumbered by its technicalities, and is almost necessarily possessed with a high idea of its exclusive importance. It is through the medium of such prepossessions that he surveys the Systems of every other School, and by them he has been induced to allow rather more than a patriotic space to the labours of his countrymen, with whom he evidently thinks that the only chance of philosophical regeneration resides. It is necessary to bear this in mind whenever the opinions of the writer under consideration elicit those of the Critic; who nevertheless has exercised considerable forbearance in withholding as much as possible his private judgment.

One of the greatest advantages possessed by this excellent Manual is its copious Bibliography; indicating all that is worth reading, (and much that is not), on every subject it embraces; and presenting us with a catalogue of each author's works, and those of his commentators and opponents. In this department it will be found that the titles of works in German which relate to the Classics

or to writers of the Middle Ages, have been generally translated by me, in order to point out to the reader the large mine of various information contained in the libraries of Germany. But when arrived at the metaphysicians of that country, I have judged it better to retain the actual titles of their works and those of their commentators, as the books may be thus more easily procured than if their titles had been translated; and because no one was likely to attack in their own language the metaphysical works of Kant or of Schelling, who was not competent to peruse their titles at least in the original.

I could have wished indeed that circumstances had permitted me to enlarge the catalogue of English and Scottish writers at the expense of those of Germany, but in the mean time, while I have preserved in the text the names of all the metaphysicians of every German school, I have occasionally forborne to particularise *all* the compositions of some among them who are known to us only as obscure commentators on exploded systems. A few treatises on *other* subjects I have struck out from the Bibliography, as not likely to be useful, or because they were not readily procurable by the English reader. In the place of those omitted, others have been added, and more would have been, had not the *supellex* already furnished been more than ample for all the purposes of the student, to whatever extent he may desire to push his inquiries.

The reader will observe, that the numeration of the sections in the present translation, after § 252, does not always correspond with that of the German. This has been occasioned by my subdividing some sections which originally formed one, and simplifying in one or two instances the numeration observed in the original; but principally in consequence of my abridging the introductory sections from 306 to 316, which it appeared advisable to do, on account of the obscurity, as well as the repetition, which there encumbers the original. The *running-titles* and the *names* of the philosophers, will sufficiently guide any one who may wish to compare the translation with the original, and obviate all difficulty which might

result from such a change. The references to the sections have been uniformly corrected according to the numeration thus established; and it is hoped that many errors will not be discovered in the voluminous and minute bibliography which has cost the translator so much care.

To these trivial alterations I am compelled to add that I have judged it better to omit altogether a few passages which appeared to militate against Revealed Religion, rather than to alter or to soften them. These instances, however, are exceedingly rare.

In this task, (the difficulty of which will be appreciated by few), I have been materially assisted by the excellent French translation of M. Victor Cousin<sup>b</sup>, well known in the philosophical and literary world for many important publications. His thorough acquaintance with the subject, no less than his knowledge of German, admirably qualified him for the undertaking he has so well executed; and if it be sometimes the case that the "Interpreter is the harder of the two," the fault is not that of M. Cousin, but of the French language, which, at least to English apprehensions, often fails to convey as accurate a sense of metaphysical distinctions as that presented by the homespun compounds of the corresponding German. I have followed M. Cousin in placing the references at the bottom of the page, instead of incorporating them with the text, as the German typographers delight in doing; to the great embarrassment of the English reader, and to the visible disfigurement of the page. A very few references have been occasionally omitted, as belonging to points which did not appear to me necessary to be substantiated by a quotation.

Occasionally, when an expression in M. Cousin's translation has seemed to me more felicitous than the original it represents, I have endeavoured to give the spirit of the former: in one or two particulars also I have preferred his subdivisions, as being more simple than those of

<sup>b</sup> *Manuel de l'Histoire de la Philosophie, traduit de l'Allemand de Tennemann, par V. Cousin, Paris et Bruxelles, 1829, 2 vols. 8vo.*

M. Wendt, and recommended by his perfect acquaintance with philosophical history.

If I were to step for a moment out of the humble path of a translator, and offer a remark on the *matter* which has of late occupied so large a portion of my time, I should be inclined to suggest a conclusion very different from that with which Tennemann has summed up his great undertaking. He confidently anticipates that the disputes which, from the days of Thales, have continued to agitate the philosophical world, will all eventually conduct mankind to the discovery of true philosophy; and that all the deviations of Human Reason from the right path will prove to have been only so many avenues to the desired object. Far different is the sentiment his translator is tempted to express! Of these everlasting disputes what has been the result? How little has been gained by endless controversy? System has expelled system only to succeed one another, like the phantasmagoria with which children are amused: one gaudy and disproportioned figure making way for another,—equally motley and equally unsubstantial!

When the learned Casaubon visited for the first time the Sorbonne, his pompous Cicerone exclaimed, “Here, sir, is a court which for five hundred years has been the scene of incessant disputations!” “Eh bien! et qu’a-t-on donc *prouvé*?” demanded the acute Genevese.

These endless disputes, however, and ineffectual efforts will not have been without their use, nor will the record of them have proved an unprofitable task, if they should lead the student to a conclusion widely different from that adopted by Tennemann, but resting on a much surer foundation. The inadequacy of Human Reason to satisfy its own requirements, ought to incline the learned and the wise a little to mistrust the guide to which they are apt to commit themselves without hesitation; and the monstrous absurdities which have been embraced by many who had rejected the plain evidences of Revelation may convince us of the fallibility of the most acute understandings, when they surrender themselves to their own

unlimited control. The most fantastical dreams of the wildest religious enthusiast were never more repugnant to common sense than the Neoplatonism of Proclus, the Absolute Identity of Schelling, or the *Ego* and *Non-Ego* ravings of Fichte.

It is pleasing to reflect that those philosophers whose views in Science were the most profound and wise, were among the firmest friends of Revealed Religion.

I regret that notwithstanding the pains that have been taken, some typographical errata occur, for which my absence from Oxford may not be thought a sufficient excuse. Some of these are noticed at the end, and it is hoped there are not many more,—the nature and extent of the work considered.

I am fully sensible of *other* imperfections for which I alone am responsible, and for which my regret that they exist is no apology.

*Cheltenham,*  
*February 1st, 1832.*

# A MANUAL

## OF THE

### HISTORY OF PHILOSOPHY.

---

#### SECTION I.

**A HISTORY** of philosophy, to be complete, demands a preliminary inquiry respecting the character of this science, as well as respecting its subject-matter, its form, and object; and also its extent or comprehensiveness, its method, its importance, and the different ways in which it may be treated. All these particulars, with the bibliography belonging to it, will form, together with some previous observations on the progress of philosophic research, the subject of a *general* introduction. The *particular* introduction will carry us on to the first period of this history, through a rapid survey of the religious and philosophical opinions of the Orientals, as well as the first attempts of the Greeks.

# GENERAL INTRODUCTION.

---

## CHAPTER I.

### CHARACTER, EXTENT, METHOD, IMPORTANCE, DIVISION, AND BIBLIOGRAPHY OF THE HIS- TORY OF PHILOSOPHY.

#### I. *Character of the History of Philosophy.*

† CH. LEONH. REINHOLD, *On the Character of the History of Philosophy*, in the collection of Fülleborn; Fasc. I.

† GEO. FRED. DAN. GOESS, *Essay on the Character of the History of Philosophy, and on the System of Thales*, *Erlangen*, 1794, 8vo. with a sketch of the proper limits of the History of Philosophy, *Leips.* 1798, 8vo.

† J. CHRIST. AUG. GROHMANN, *On the Character of the History of Philosophy*, *Wittenberg*, 1797, 8vo.

† W. GOTTL. TENNEMANN, *History of Philosophy*, vol. i, *Leips.* 1798, 8vo.

† FRED. AUG. CARUS, *Observations towards a History of Philosophy*, *Leips.* 1809.

† CH. FRED. BACHMANN, *On Philosophy and its History*; three Academic lectures; *Jena*, 1811, 8vo. *On the History of Philosophy*, second edition, remodeled, with a dedication to Reinhold, *Jena*, 1820, 8vo.

† CHRIST. AUG. BRANDIS, *On the Character of the History of Philosophy*, *Copenhagen*, 1815, 8vo.

2. The human mind has a tendency to attempt to enlarge the bounds of its knowledge, and gradually to

aspire to a clear development of the laws and relations of nature, and of its own operations. At first it does nothing more than obey a blind desire, without accounting to itself sufficiently for this instinctive impulse of the understanding, and without knowing the appropriate means to be employed, or the distance by which it is removed from its object. Insensibly, this impulse becomes more deliberate, and regulates itself in proportion to the progress of the understanding, which gradually becomes better acquainted with itself. Such a deliberate impulse, is what we call Philosophy.

3. Thereupon arise various attempts to approximate this mental object of the understanding<sup>a</sup>: attempts more or less differing in respect of their principles, their methods, their consequences, their extent, and, in general, their peculiar objects. In all these attempts, (which take the name of *Philosophic Systems*, when they present themselves in a scientific form, and the value of which is proportionate to the degree of intelligence manifested by each particular philosopher;) we trace the gradual development of the human understanding, according to its peculiar laws.

4. But the development of human reason is itself subject to external conditions, and is sometimes seconded, sometimes retarded, or suspended, according to the different impressions it receives from without.

5. To give an account of the different works produced by the understanding, thus in the progress of improvement, and favoured or impeded by external circumstances is, in fact, to compose a history of philosophy.

6. The subject-matter of the history of philosophy, is both external and internal. The internal or immediate

<sup>a</sup> WEILLER, Kajet., über das Verhältniss der philos. Versuche zur Philos. (Schulschrift, 1812) in dem zweit. Bd. der akad. Reden und Abhandlungen, 1822, 8vo.

embraces, 1st. The efforts continually made by the understanding to attain to a perception of the first principles of the great objects of its pursuit (§ 2), with many incidental details relating to the subject of investigation, the degree of ardour or remissness which from time to time have prevailed; with the influence of external causes to interest men in such pursuits, or the absence of them. 2dly. The *effects* of philosophy, or the views, methods, and systems it has originated; effects varying with the energies out of which they sprang. In these we see the understanding avail itself of *materials*, perpetually accumulating towards constituting philosophy a science, or *rules* and *principles* for collecting materials to form a scientific whole; or, finally, *maxims* relating to the method to be pursued in such researches. 3dly and lastly: We observe the development of the understanding as an instrument of philosophy, that is to say, the progress of the understanding towards researches in which it depends solely on itself; in other words its gradual progress towards the highest degree of independence: a progress which may be observed in individuals, in nations, and in the whole race of man.

*Observation.* The history of *systems of philosophy* is not to be confounded with the *history of philosophy*.

7. The *external matter* consists in the causes, events, and circumstances which have influenced the development of philosophic reason, and the nature of its productions. To this order of facts belong: 1st. The individual history of philosophers, that is to say, the degree, the proportion, and the direction of their intellectual powers; the sphere of their studies and their lives, the interests which swayed them, and even their moral characters. 2dly. The influence of external causes, that is to say, the character and the degree of mental cultivation prevalent in the countries to which they belonged; the prevailing spirit of the times; and, to ascend still farther, the climate and the properties of the country; its institutions, religion, and language. 3dly. The influence of

individuals in consequence of the admiration and imitation they have excited, by their doctrines or example; an influence which betrays itself in the matter as well as in the manner of their several schools. (Bacon, Locke, Leibnitz.)

8. The *form* of the history of philosophy consists in the suitable arrangement of these two classes of materials, so as to make one scientific whole. Nevertheless, the result is modified, partly by the end of history in general, and partly by the special end of the history of philosophy.

9. History in general is distinguished, when properly so called, from Annals, Memoirs, etc. by its form: i. e. by the combination of its incidents, and their circumstantial development.

10. To enable the history of philosophy to satisfy an enlightened curiosity, not merely a vain and idle one, its object ought to be thoroughly to explore, through its continual alternations of improvement and declension, the progress of a philosophic spirit, and the gradual development of philosophy as a science. This end cannot be attained by a mere acquaintance with historic facts, but rather by contemplating their mutual dependence, and connecting their causes and effects.

11. The efforts of philosophic reason are internal to the mind; but by their publication, and the influence they exert on the world without, they assume the character and enter into the combinations of *external* facts. The facts therefore which form a groundwork for the history of philosophy may be regarded as both external and internal; because, 1st. They stand in connection with chronology, as successive or contemporaneous events. 2dly. They have their external effects and causes. 3dly. They have their origin in the constitution of the human understanding, developing themselves

in a variety of combinations and mutual relations. 4thly. They have reference to a mental object.

12. The *formal* character, therefore, of a history of philosophy will be modified according to the above four-fold relation, and by its proper end, which is to demonstrate at once circumstantially and with a scientific view, the causes of every revolution, and its consequences.

*Observation.* The circumstantial account does not consist merely in a chronological statement of a series of facts, but assumes such a series as its text and groundwork. It is very compatible with a scientific character in the history of philosophy; at the same time that it must be borne in mind, that a history of philosophy is not philosophy itself. See the work of Grohmann cited above, at the head of § 2.

13. Consequently, the history of philosophy is the science which details the efforts of the human understanding to realise the idea of philosophy, by exhibiting them in their mutual dependency: it is a systematic arrangement of facts illustrating the continual development of philosophy, as a science.

*Observation.* There is a difference to be observed between the history of philosophy, and the history of mankind,—the history of the cultivation of the human understanding, and the history of the sciences. The biography of philosophers, the examination of their writings, the statement of their opinions, and the bibliographical history of philosophy in general, are either preliminary lights and aids, or constituent parts, of the history of philosophy.

## II. *Comprehensiveness and Commencement of the History of Philosophy.*

· See in addition to the works cited above, at the head of § 2, † BØERGE RUSBRIGH, on the Antiquity of Philosophy, and the Character of this Science, translated from the Danish into German by J. AMB. MARKUSSEN, *Copenh.* 1803, 8vo.

14. The history of philosophy does not affect to comprehend all the ideas, hypotheses, and caprices which have found a place in minds addicted to philosophic researches; such an attempt would be equally impracticable

and unprofitable. The only philosophic opinions which deserve to be recorded, are those which may claim to be so for their originality, their intrinsic worth, or their influence in their own and subsequent epochs.

15. It must be granted that philosophy has had a *beginning*, because it is nothing else than a superior degree of energy and activity in the exercise of reason, which must have been preceded by an inferior. But it is not necessary that the history of philosophy should embrace all its first efforts, or ascend up to the very cradle of our species.

16. No sufficient reason has been alleged to induce a belief in the existence of a Primitive Philosophic People, with whom philosophy might be supposed to have commenced, and from whom all philosophic knowledge might have emanated; for an aptness to philosophise is natural to the human mind, and has not been reserved exclusively for any one people. The very hypothesis of such a people would remove only one step farther the question of the origin of philosophy. Nor must we dignify with the name of science the symbolical notions of some of the earlier races, which did not as yet clearly apprehend and grapple with their objects.

*Observation.* The idea of a Primitive Philosophic People is founded; 1st. On the hypothesis that all instruction came by revelation. 2dly. In the tendency of the understanding to refer correspondent facts to the same origin. 3dly. In the attempt to render certain doctrines more venerable by their high antiquity. The general cause is to be sought in the indolence natural to human nature, and the habit of confounding opinions which have a semblance of philosophy with philosophy itself. The writers who have devoted themselves to the critical examination of history with a theological view, have declared the Hebrews to be the primitive race; others (like Plessing) the Egyptians; and these last have recently (since the writings of Fred. Schlegel), been displaced by the Hindoos.

17. Although we discover in every people the traces of a spirit of scientific inquiry, nevertheless this general

disposition does not appear to have developed itself in all in an equal degree: nor has philosophy among all attained to the character of a science. In general, it seems as if nature employed the civilization of one nation as the means of civilizing others, and accorded only to a *few* the distinction of originality in intellectual discovery. Consequently, all nations have not an equal claim to a place in the history of this science. The first belongs to those among whom the spirit of philosophy, originally aided by a slight external impulse, has felt itself sufficiently strong to advance to independent researches, and to gain ground in the paths of science; the second belongs to such as, without possessing so much originality and spontaneous exertion, have adopted philosophic ideas from others,—have made them their own, and thereby exerted an influence over the destinies of philosophy.

18. The Greeks are the nation whose originality of genius has created an era in the history of this science. In fact, although they were dependent for part of their first civilization on other nations, and have received from foreigners certain materials and incitements to the study of philosophy, we can perceive that they evinced themselves a lively and sincere interest in such investigations, and among them this curiosity assumed a scientific character, and imparted the same to the language itself. It is among the Greeks, then, that we find for the first time a truly philosophic spirit, united to literature and good taste, and a scientific spirit of investigation which centered in the contemplation of the Nature of Man: to this succeeded the desire of investigating to the end and consolidating these first bases of study (the origin this of *scepticism*); and at length ensued the formation of a philosophic language and method. We have moreover positive and certain testimonies to enable us to follow, on grounds altogether historical, the origin and development of the philosophic literature of this nation. We may add that the philosophy and, in general, the science

of the Greeks naturally combine and form a whole with those of more recent nations.

19. The Orientals, prior to the Greeks in point of antiquity and the date of their civilization, never attained to the same eminence, at least as far as we are enabled to judge. Their doctrines were constantly invested with the character of *Revelation*, diversified by the imagination under a thousand different aspects. Even among the Hindoos they wear a form altogether mystical and symbolical. It was the genius of these nations to clothe in the colours of the fancy the opinions of the understanding, and a certain number of speculative notions, more or less capriciously conceived, in order to render them more evident; without troubling themselves to examine the operations of mind and their principles; with its movements progressive and retrograde. The notions respecting the Deity, the world, and mankind, which these nations incontestably entertained, were not, with them, the causes nor the consequences of any true philosophy. Their climate, their political constitution, and despotic governments, with the institution of castes, were often obstacles to the free development of the mind. Besides, the history of these nations continues still to be involved in obscurity; there is a want of positive and certain information; and the relation their intellectual progress bears to the history of philosophy cannot as yet be sufficiently ascertained.

*Observation.* There are some interesting remarks on the Greek and Oriental characters, and on the causes of their diversity in the work of † J. AUG. EBERHART, entitled the Spirit of Primitive Christianity, vol. i, p. 63, sqq. What is generally understood by the Barbaric philosophy? See Diog. Laert. I, 1, sqq.

20. The true commencement, therefore, of the history of philosophy must be sought among the Greeks, and particularly at that epoch when, by the progress of imagination and intellect, the activity of the understanding had attained a high degree of development: an

epoch when the minds of men become more independent of religion, poetry, and politics, applied themselves to the investigation of truth, and devoted themselves to regular studies. This state of things may be referred to the epoch of Thales. The different directions and forms which, in the course of ages, this spirit of philosophic research assumed; and the effects, of every kind, which it produced, derived, through different channels, from the Greeks to the moderns, constitute the province of the history of philosophy.

*Observation.* The definition of the true limits of the history of philosophy has only of late become an object of inquiry: (the system of ethnography, or partial histories of particular nations) opposing itself to anything like a precise limitation, and even yet there is nothing satisfactorily determined on this point; only Tiedemann would exclude the Orientals. The reasons assigned on the other hand by † CARUS, *Thoughts on the History of Philosophy*, p. 143, and † BACHMANN, *On Philosophy and its History*, and the same author, *Dissert. Philos. de peccatis Tennemanni in historiâ Philosophiæ*, *Jen.* 1814, 4to., fail to prove that they necessarily belong to philosophy. It is true that a great interest attaches to the investigation of their doctrines, but we must distinguish well between this and the proper interest of the history of philosophy. On the whole, it may not be useless to preface the statement of Greek philosophy, by a brief review of the philosophic and religious opinions of the principal nations who, in a greater or less degree, have had relations with the Greeks.

### III. *Method.*

Consult, besides the works cited before (§ 2) † CHRIST. GARVE, *De ratione scribendi historiam Philosophiæ*, *Lips.* 1768, 4to. and *Legendorum veterum præcepta nonnulla et exemplum*, *Lips.* 1770, 4to. both contained in FULLEBORN's Collection, etc. Fasciculi xi, xii.

† GEO. GUST. FULLEBORN, *Plan of a History of Philosophy*, in the iv. Fasc. of his Collection; and, † What is meant by a representation of the Spirit of Philosophy? Fasc. v.

† CHRIST. WEISS, *On the Method of treating the History of Philosophy in the Universities*, *Leips.* 1800.

21. The *Method*, determined by the end of the sci-

ence (§ 10), consists in the rules agreeably to which the materials ought to be investigated, collected, prepared, and combined to form a whole.

22. The materials for the history of philosophy may be either accidentally met with, or methodically investigated. In the latter case we ought to inquire especially what are the authorities and what should be the procedure of a well-directed research. The sources to which we may have recourse are of two sorts; the works themselves of philosophers which have descended to us; and the notices afforded by other writers concerning the lives and the doctrines of these philosophers; testimonies, the authenticity and probability of which should be critically examined. The less that any philosopher has written, or the less his writings have been preserved, the more we should seek to collect information from other authors; but, at the same time, the more necessary it becomes to be cautious in our adoption of such information<sup>b</sup>. When only fragments remain, it is well to consider them not only philosophically but critically.

23. Besides collecting the propositions of philosophers, it becomes necessary to study their true sense, their extent, their origin, and their mutual connection<sup>c</sup>, in order to be enabled to assume the true point of view in which the philosopher himself stood, and to appreciate the merit of his labours, without exaggeration, and without injustice. The means to this end are a perfect acquaintance with his contemporaries, with the idioms of the language, and the course of men's ideas at that time; as well as a comparison of different authorities and testimonies with a view to ascertaining their credibility. In order to attain to a faithful and true representation of the meaning and the merit of different philosophical systems, it is indispensably neces-

<sup>b</sup> See H. KUNNHARDT, *De fide historicorum recte æstimandâ* in *Hist. Philosophiæ*. Helmst. 1796, 4to.

<sup>c</sup> Apply this, for example, to the *natura convenienter vivere* of the Stoics, and their *ἀκαταληψία*.

sary that we should compare one philosophical doctrine with analogous ones, whether contemporary or posterior; that we should determine with care its points of approximation and divergency; that we should investigate its place in the general system of its author, and the manner in which he appears to have been led to this doctrine; in which particular, care must be taken to distinguish between internal principles and external causes.

24. The management of the materials thus critically analyzed, demands a particular care in the choice of expression; particularly in the case of technical terms, which it is necessary to render with perspicuity; without, however, giving them too foreign an air and character, e. g. the *ἐξῆς*, *habitus*, of Chrysippus. For the *connection* of these materials, it will result from that chronological and systematic dependency of which we have spoken (§ 2), and especially from their joint relation to the final object and end of the understanding (§ 3).

*Observation.* The particular ends contemplated in such a work may justify a certain diversity in the manner and method of it: and may help to resolve the question (according to circumstances), whether it should be accompanied or not by criticism.

25. In combining these materials into a whole it is necessary to direct an earnest and constant attention to the development of reason, and to the progressive advancement of science. With this view we should establish points of repose, consisting in divisions and subdivisions, which ought, not merely to enable the reader the better to glance over the work, but should offer a clearer view of the whole, and of the mutual relation of its parts.

*Observation.* The ethnographical method, which prevailed up to the time of Tiedemann, is useful for a collection of the materials proper for a general or special history of philosophy; but will not form such a history itself.

26. Assuming the above principle, it is required to

constitute distinct epochs: 1st. That a sensible progress should have taken place in the improvement of reason, and that new lights and new principles should have been introduced into philosophy itself, influencing the scientific combination of acquired knowledge. 2dly. That great external events should have had a powerful and lasting influence over philosophy<sup>d</sup>.

27. Three principal periods may be defined in the history of philosophy. First period: Comprising an account of the efforts of the understanding to acquire a knowledge of first principles, and the laws of nature, and freedom of will and action; without a clear consciousness of the method most conducive to such knowledge:—*Greek and Roman philosophy*. Second period: Efforts of the understanding towards the same end, but under the influence of a principle superior to itself, derived from Revelation; subsequently an impulse to free itself from any imposed restraint; followed by a fresh subjugation to another arbitrary formulary; a spirit exclusively dialectic:—*Philosophy of the Middle Ages*. Third period: Fresh and independent exertions towards the discovery of first principles; with the purpose of arranging all human knowledge in a more complete and systematic form; an epoch remarkable for the manner in which it has contributed to investigate, found, and define the principles of philosophy as a science.—*Modern Philosophy*.

KRUG, in his *History of Ancient Philosophy*, p. 28, admits only two divisions, that of ancient and modern philosophy. He assumes as the line of demarcation the decline of government, manners, arts, and sciences, during the first five or six centuries of the Christian era.

#### IV. *Importance of this History.*

† FR. ANT. ZIMMERMANN, *Dissertation on the Utility of the History of Philosophy*, *Heidelb.* 1785, 4to.

<sup>d</sup> DAN. BOETHIUS, *De præcipuis Philosophiæ epochis*. *Lond.* 1800, 4to.

† GEO. GUST. FULLEBORN, Some general Deductions from the Hist. of Philosophy in his Collection, Fasc. iv, and, On certain Advantages resulting from the History of Ancient Philosophy, Fasc xi.

† H. RITTER, On the Advancement of Philosophy through the History of Philosophy (a supplement to his work, On the Influence of Descartes), *Leips.* 1816, 8vo.

28. If philosophy may claim the highest interest, as the most elevated of human sciences, its history, for the same reason, ought to possess a great importance. Whoever is interested in philosophy ought not to be ignorant of its history, and progress.

29. The history of philosophy, besides, possesses a scientific merit peculiar to itself; it disposes the mind to a free employment of its powers, furnishes it with useful results, respecting the proper method to be followed, renders it more sensible to its aberrations, with their causes and consequences, and thereby furnishes a valuable assistance towards establishing rules for a right conduct of the understanding, in order to the attainment of new lights, and discovery of fresh paths: sources of information indispensable to philosophy, so long as it must be considered as in a progressive state, and not yet fully matured.

30. The history of philosophy has a connection with all the other sciences and their history; more especially with the history of Religion and of Mankind, because Reason is the basis of all knowledge, and embraces the ultimate end of all theoretical and all practical employment of our faculties.

31. As a department of study, such history may materially improve the understanding, all the powers of which it exercises in the research and exposition of the different systems. Nor is it less calculated to influence the *habits* of the mind, inasmuch as it teaches the renunciation of prejudices, modesty in forming an opinion, and tolerance of the opinions of others: its

tendency is to secure the mind from exaggerated admiration, and to moderate attachment to opinions received on the faith of authority.

*Observation.* On the other hand, has not the study of the history of philosophy its disadvantages? What are they, and how do they present themselves?—Indecision, and hesitation of judgment, indifference to the truth and the value of every rational research, can only be effects of a light and superficial study, where the diversity of opinions is the only thing contemplated, without regard had to their principles: where the difference of doctrines is the only thing attended to, without ascending to the points of union which they have in common. Here may be applied what Bacon says of philosophy.

#### V. *Different ways in which the History of Philosophy may be treated.*

32. The history of philosophy divides itself into universal and particular, according to the extent of the objects which it may be the author's design to embrace. The first is the statement, by facts, of the progress of philosophy, considered as Science in general, in its principal directions, and its most conspicuous results. This sort of history embraces a consideration of the principles of all philosophy; the most distinguished systems of philosophers; and the progress which they have enabled the philosophical sciences to make in their several departments. The second is employed about instances of the progress of the understanding confined within certain limits of time and place; and limited to certain particular directions, or certain special objects of philosophy.

*Observation.* † CARUS, *Thoughts on the History of Philosophy*, p. 106, defines the universal history of philosophy as, "the natural history of human reason, its pursuits and productions." But he takes this definition in so loose a sense, that he gives us, instead of historic facts, nothing but a meagre and barren abstract of general conclusions. This way of viewing the matter does not answer the true end of a history of philosophy; the second chapter of this general introduction contains the substance of it.

33. The universal history of philosophy, may be presented in an abridged or a detailed form. The principle of a good abridgment is to present a review, as complete as possible, of all the essential subjects of discussion, with a due regard to perspicuity and brevity. Truth, impartiality, and conciseness are of course requisite.

34. Agreeably to what has been laid down (§ 32) we may define many kinds of *particular histories* of philosophy; such as, 1st. (From a relation to certain times or places;) histories of the philosophy of particular epochs; e. g.—of the ancients, of the middle ages, or of the moderns; with numerous subdivisions, embracing histories of the philosophy of this or that particular nation. 2dly. (From a relation to certain particular pursuits or special objects of philosophy;) histories of systems or schools, or literary questions, taken separately; of different philosophical *methods*; of the technical language of philosophy; histories of certain branches of philosophy; histories of certain philosophical notions, principles, or theories. If a particular philosophical history be limited to one single object, we have then a special history—a monography.

35. There is an intimate relation between particular and universal history. The first supplies the other with useful and various materials; but the latter, in its turn, develops general views, and affords lights for the examination and exposition of the particular details. Consequently they can only become perfect when united.

## VI. *Various Histories of Philosophy.*

36. The history of philosophy has not been separately treated, as a distinct science, by the ancient philosophers. They have touched upon the subject only while occupied with the statement of their own doctrines, and only so far as the points they adverted to bore a relation to what

they taught themselves, in which respect the critical judgment of Aristotle threw a light upon the opinions of his predecessors. A collection of historic documents illustrative of the gradual development of philosophy, was the first step towards a history of the science. Even in modern times the earliest attempt at this sort of history was made in the form of a compilation, and the model assumed was the work of Diogenes Laertius. The prevailing notion of the time was that of a primitive philosophic race (§ 16), and that all philosophy was derived from revelation; the *ethnographical* method being adopted in the execution (cf. § 25, *obs.*). First period. *Bayle* awakened a spirit of criticism in this kind of undertaking; *Jac. Thomasius* extended the circle of study necessary to the same; and *Leibnitz* indicated what the history of philosophy ought to be. Second period. from *Brucker* to *Tennemann*: philology and criticism improved the materials collected; some imperfections in the works of the preceding age were corrected, and the science assumed more elevated pretensions. *Brucker* published the most complete work yet known, which, by a laborious assemblage of documents, by the judiciousness of his remarks, and particularly by what it contains on the biography of the philosophers, continues to be useful: but is deficient in a philosophic spirit. *Gurlett* and *Tiedemann* pursued a better method, and rendered great services to its special history.—From *Kant* to our own time; a zealous industry has been applied to its improvement in respect of *theory* and *method*; and, in consequence of the inquiries which this new sort of study has suggested, examination has been made of its proper sources and principles; documents have been revised, and their contents more ably stated; under the influence, more or less sensible, of a philosophical spirit and system\*. The German nation has done

\* See a review of the principal services rendered to the history of philosophy since 1780, in the Philosophical Journal of NIETHAMMER, 1795, Nos. viii. and ix. TENNEMANN'S Review of the Labours of the History of Philosophy in the last fifteen years of the eighteenth Century, in the *Ergänzt. der Allg.*

the most for this description of history, as regards both its manner and its matter; but there is still occasion for much labour in this extensive field.

## VII. *Bibliography of the History of Philosophy.*

37. Under this head are comprehended the works relative to the history of philosophy in general and in particular. We shall particularise the writings on individual subjects, as they shall come under consideration. The works on the universal history of philosophy may be arranged under five heads: (*a*) Treatises on its Literature and Method. (*b*) Collections. (*c*) Miscellanies. (*d*) Detailed histories. (*e*) Outlines.

### (*a*) Bibliographical Treatises.

J. JONSIUS, *De scriptoribus Hist. Philosophicæ libri iv*, *Francof.* 1659.—*Recogniti et ad præsentem ætatem usque perducti*, cura J. CHR. DORN, *Jen.* 1716, 8vo.

† J. ANDR. ORTLOFF, *Bibliographical Manual of the History of Philosophy*, *Erlangen*, 1798, 8vo. part i, never completed.

N.B. The *Treatises on Method* have been cited under the preceding sections.

### (*b*) Collections.

JAC. THOMASII, *Schediasma historicum, quo varia discutiuntur ad historiam tum philosophicam tum ecclesiasticam pertinentia*. *Lips.* 1665, 4to. The same work under this title: *Origines historiæ philos. et ecclesiast.*, cura CHR. THOMASII, *Hal.* 1699, 8vo.

J. FRANC. BUDDEI, *Analecta Historiæ Philosophiæ*, *Hal.* 1706, 8vo. second edition, 1724, 8vo.

† *Acta Philosophorum*: by CHR. AUG. HEUMANN, 3 vols. 8vo. *Hal.* 1715-23.

JAC. BRUCKERI, *Otium Vindelicum, sive meletematum Historico-philosophicorum triga*, *Aug. Vind.* 1729, 8vo. *Miscellanea historiæ philosophicæ, litterariæ, criticæ, olim sparsim edita, etc.* *Aug. Vind.* 1748, 8vo.

*Lit. Z.* 1801, s. 81—147, and CARUS, *Hints on the History of Philosophy* *Leips.* 1809, s. 21—90.

CHR. ERN. DE WINDHEIM, *Fragmenta historiæ philosophicæ*, etc. *Erl.* 1753, 8vo. With essays of various other authors.

† MICH. HISMANN, *Magazine of Philosophy and its History*, *Goetting. et Leips.* 1778-83, 6 vols. 8vo. In this work are many essays translated from the *Académie Royale des Inscriptions*, etc.

† GEO. GUST. FUELLEBORN, *Collection of Pieces towards a History of Philosophy*, *Züllichau*, 1791-99, Fasc. xii, 8vo.

GUILL. TRAUGOTT KRUG, *Symbolæ ad Histor. Philosophiæ*, *Leips.* 1813, 4to. Part first.

† J. FRED. FRIES, *Pieces towards a History of Philosophy*, *Heidelberg*, Fasc. i.

(c) *Miscellanies*, containing researches and remarks on the History of Philosophy.

The true Intellectual System of the Universe, by RALPH CUDWORTH, etc. *Lond.* 1678, folio, second edition, by BIRCH, 1743, 2 vols. 4to. and 8vo. *Lond.* 1820, and *Oxford*, 1829.

CUDWORTHI *Systema Intellectuale hujus Universi, seu de veris naturæ rerum originibus commentarii, quibus omnis eorum philosophia qui Deum esse negant, funditus evertitur: accedunt reliqua ejus opuscula*, *Jen.* 1733, folio; second edition, *Leyd.* 1773, 2 vols. 4to. translated by Mosheim [with the addition of many learned notes and dissertations by the translator.].

HUETII, *Demonstratio Evangelica*, *Paris*, 1679, folio, often republished.

*Dictionnaire historique et critique*, par J. BAYLE, *Rotterd.* 1697, 2 vols. folio. The best edition is the fourth, reviewed and augmented by DESMAIZEAUX, *Amst. et Leid.* 1740, 4 vols. folio. Various translations and extracts. [A continuation has been published by J. G. CHAUFFPIE, *Amst.* 1750, likewise in 4 vols. folio.]

† ERN. PLATNER, *Philosophical Aphorisms, with some Principles for a History of Philosophy*, *Leips.* 1782, 2 vols. 8vo. a second edition, 1793-1800, 8vo.

(d) *Detailed Histories.*

The History of Philosophy by THOMAS STANLEY, *Lond.* 1655, folio, third edition, 1701, 4to. Latin translation with corrections by GODEFR. OLEARIUS, *Historia Philos. Lips.* 1711, 4to. et *Ven.* 1733, 4to.

*Histoire critique de la Philosophie, où l'on traite de son Origine, de ses Progrès et des diverses Révolutions qui lui sont arrivées jusqu'à notre temps*, par M. D\*\*\* (ANDR. FR. BOUREAU DES-

LANDES), *Paris*, 1730-36, 3 vols. Another edition, *Amsterd.* 3 vols. 8vo.

† J. J. BRUCKER, Questions on the History of Philosophy, *Ulm*, 1731-36, 7 vols. 12mo. with a Supplement, 1737, 12mo.

J. BRUCKER, *Historia critica Philosophiæ a Mundi incunabulis*, etc. *Lips.* 1742-44, 5 vols. 4to. a new edition without alterations, but augmented by a Supplement, 1766-67, 6 vols. 4to. An English Abridgment by W. ENFIELD, *History of Philosophy from the earliest times*, etc. *Lond.* 1791, 2 vols. 4to. again in 8vo. 2 vols.

AGATOPISTO CROMAZIANO (APPIANO BUONAFEDE), *Della Istoria e della indole di ogni Filosofia*, *Lucca*, 1766-71, 5 vols. 8vo. Again *Venice*, 1782-83, 6 vols. 8vo. For the continuation of this work see § 38 (*a*).

† History of Philosophy for Amateurs, by J. CHRIST. ADELUNG, *Leips.* 1786-87, second edition, 1809, 3 vols. 8vo.

† J. GLIEB BUHLE, *History of Philosophical Reason*, *Lemgo*, 1793, 8vo. vol. I. Instead of this work, which he did not continue, Buhle published † A Compendium of the History of Philosophy, and a critical Bibliography of this Science, *Goetting.* 1796-1804, 8 vols. 8vo. We may here add the work cited in § 38. on Modern Philosophy, which is preceded by a Review of the Ancient Systems of Philosophy up to the fifteenth century.

† G. GOTTLIEB TENNEMANN, *History of Philosophy*, *Leips.* 1798-1819, 11 vols. 8vo. One vol. of second edition published by A. WENDT, 1828.

DEGERANDO, *Histoire comparée des Systèmes de la Philosophie*, 1804, 3 vols. 8vo. second edition, augmentée, 4 vols. 8vo. *Paris*, 1822. A German translation by TENNEMANN, *Marburg*, 1806-7, 2 vols. 8vo.

† J. HENR. MART. ERNESTI, *An Encyclopedic Manual of General Hist. of Philos. and its Bibliography*, *Lemgo*, 1807, 8vo.

† FRED. AUG. CARUS, *Hints for a Hist. of Philos.* *Leips.* 1809, 2 vols. 8vo. (in the fourth volume of his posthumous works).

† E. G. STECK, *the History of Philosophy*, vol. I, *Riga*, 1805, 8vo.

† C. J. H. WINDISCHMANN, *Die Philosophie im Fortgang der Weltgeschichte*, *Bonn*, 1827, 8vo.

### (*e*) *Outlines.*

Omitting the sketches of the History of Philosophy, which, since the time of Buddeus, may be found at the head of many Manuals of Philosophy, we shall merely notice the following abstracts:

GEO. HORNII, *Historia Philosophica*, *Lugd. Bat.* 1655, 4to.

LAUR. REINHARTI, *Compend. Hist. Philosoph.* *Lips.* 1724, 8vo.

JO. GOTTL. HEINECCI, *Element Hist. Philosophicæ*, *Berolin.* 1743, 8vo.

† J. BRUCKER, *Abridgment of his Questions on the History of Philosophy*, *Ulm*, 1736, 12mo. with additions, 1737; under the title of *Elements of the Hist. of Philos.* *Ulm*, 1751, 8vo.

† J. BRUCKERI, *Institutiones Hist. Philosophicæ*, *Lips.* 1747, 8vo. second edition, 1756, third edition, by FR. GOTTL BORN, *Leips.* 1790, 8vo.

† C. G. W. LODTMANN, *Brief Sketch of the History of Philosophy*, *Helmst.* 1754, 8vo.

FORMEY, *Abrégé de l'Histoire de la Philosophie*, *Amstd.* 1760, 8vo.

† FR. ANT. BUESCHING, *Sketch of the History of Philosophy*, *Berlin*, 1772-74, 2 vols. 8vo.

† CHRIST. MEINERS, *Sketch of the History of Philosophy*, *Lemgo*, 1786, 8vo. second edition, 1789.

† JO. GURLITT, *Sketch of the History of Philosophy*, *Leips.* 1786, 8vo.

† FR. XAV. GMEINER'S, *Literary History of the Origin and Progress of Philosophy, and of its Sects and Systems*, *Greiz.* 1788-89, 11 vols. 8vo.

† J. AUG. EBERHARD, *General History of Philosophy*, *Halle*, 1788, second edition, 1796, 8vo. *Abstract of a general History*, *Halle*, 1794, 8vo.

† GEO. SOCHER, *Historical Sketch of the Systems of Philosophy from the Greeks to Kant*, *Munich*, 1802, 8vo.

† FRED. AST, *Sketch of the History of Philosophy*, *Landshut*, 1807, 8vo.

† CH. AUG. SCHALLER, *Manual of the History of Philosophical Discoveries, etc.* forming the second part of the *Magaz. für Verstandesübungen*, *Halle*, 1809, 8vo.

† PH. L. SNELL, *Brief Sketch of the History of Philosophy*: Part first, *History of Ancient Philosophy*, *Geissen*, 1813, 8vo. Part second, *History of the Philosophy of the Middle ages*, *Ibid.* 1819, 8vo.

† GAETEN WEILLER, *Sketch of the History of Philosophy*, *Munich*, 1813, 8vo.

† JOS. HILLEBRAND, *History and Methodical Systems of Philosophy*, forming the second part of his *Introduction to Philosophy*, *Heidelberg*, 1819, 8vo.

† A. T. RIXNER, *Manual of the History of Philosophy*, 3 vols. *Salz.* 1822-23, 8vo.

† L. HAMERSKÖLD, *Outlines of the History of Philosophy from the earliest times to the present*, *Stockholm*, 1822, 8vo.

38. Works on the history of philosophy in detail: classed according to the distinctions given in § 34.

### I. (a) *Histories of particular epochs.*

† W. TRAUG. KRUG, *History of Ancient Philosophy particularly among the Greeks and Romans*, *Leips.* 1827, 8vo. second edition.

† CHRISTOPH. MEINERS, *Memoirs towards a History of the Opinions prevalent during the first centuries after the birth of Jesus Christ*, *Leips.* 1782, 8vo.

AGATOPISTO CROMAZIANO (APPIANO BUONAFEDE), *Della ristaurazione di ogni Filosofia nei secoli xv, xvi, xvii.* This work may be considered as a sequel of one by the same author, mentioned in the preceding §. *Venice*, 1789, 3 vols. 8vo. † A German translation, with corrections and additions, by CH. HEYDENREICH, *Leips.* 1791-92, 2 vols. 8vo.

† J. GOTTL. BUHLE, *History of Modern Philosophy from the revival of Letters*, *Goetting.* 1800-5, 6 vols. 8vo. Cf. § 37 (d).

† A. KAYSSLER, *Memoirs towards a Critical History of Modern Philosophy*, *Halle*, 1804, large 8vo.

† CH. FRED. BACHMANN, *On the Philosophy of our own Times*, *Jena*, 1816, 8vo.

† K. J. H. WINDISCHMANN, *Critical Reflections upon the fate of Philosophy in modern times, and the commencement of a new era*, *Francof.* 1825, 8vo.

### (b) *Histories of the Philosophy of particular nations.*

(For writings on the philosophy of the most ancient nations, see below § 68, and following.)

CICERONIS, *Historia Philosophiæ antiquæ; ex omnibus illius scriptis collegit, etc.* FRID. GEDIKE, *Berl.* 1782; second edition, 1801, 8vo.

† FR. VICT. LEBRECHT PLESSING, *Historical and Philosophical Researches on the Opinions, the Theology, and Philosophy of the most Ancient Nations, and particularly of the*

Greeks up to the time of Aristotle, *Elbing*, 1785, part the first, 8vo.

† FR. VICT. LEBRECHT PLESSING, *Memnonium, or Researches to elucidate the Mysteries of Antiquity*, *Leips.* 1787, 2 vols. 8vo.

† FR. VICT. LEBRECHT PLESSING, *Researches to illustrate the Philosophy of the most remote Antiquity*, *Leips.* 1788, 2 vols. 8vo.

BERCHETTI, *Filosofia degli antichi popoli*, *Perugia*, 1812, 8vo.

† CHR. MEINERS, *History of the Origin, the Progress, and the Decline of the Sciences in Greece and Rome*, *Lemgo*, 1781-82, 2 vols. 8vo. incomplete.

The *Philosophy of Ancient Greece* investigated by W. ANDERSON, *Lond.* 1791, 4to.

(FR. DE SALIGNAC DE LA MOTHE FENELON,) *Abrégé des Vies des Anciens Philosophes, etc.* *Paris*, 1795, 8vo. 1796, 12mo.

DEFFENDENTE SACCHI, *Storia della Filosofia Greca*, *Pavia*, 1818-20, 4 vols. 8vo. (Brought down to the times of the Sophists.)

## CHAPTER II.

### SOME PRELIMINARY OBSERVATIONS ON THE PROGRESS OF PHILOSOPHIC REASON.

39. It is from *without* that the first impressions of the human mind are derived; on these it speculates, at first instinctively and without *method*; till having attained to a consciousness of itself and its capabilities, it acquires the power of exercising its faculties with a perfect knowledge of them.

Philosophy is the result of its attempts to satisfy its thirst for knowledge.

40. To know, is to have a perception of a determinate object, or the consciousness of a perception and of its relation to something determinate, and distinct from the perception itself. In all knowledge, the subject and the object are relative terms; implying the percipient and the thing perceived<sup>§</sup>.

41.

*Note of Translator.* I have judged it better to omit altoge-

§ Throughout the treatise, this is necessary to be borne in mind; and, agreeably to this distinction, what belongs to the subject is called *subjective*; and *objective* that which belongs to the object.

ther the present section (as I have taken the liberty of *altering* others), not perceiving that it could be of any utility to the reader ; even if he should be fortunate enough to comprehend it.

42. By reflection and abstraction we distinguish between our perceptions and the matter to which they have a reference, and it is only by reasoning on the former that we can hope to solve the problems which philosophy would investigate. In fact, the *objects* which present themselves to our contemplation are purely contingent, variable, and indeterminable ; while philosophy is essentially *positive*, and concerned with the higher principles of knowledge, the reasons of things—their laws—their universal and necessary ends.

44. Philosophy, as a science, pretends to a systematic knowledge of the conditions, reasons, and primary laws of all knowledge. Such a system ought to present a complete development of the principles of the human mind, and a perfect deduction of all that results from them, without *lacuna* or omission. Without this, it must be impossible to establish a theory of human knowledge which may be complete, solid, and connected through all its parts.

45. All knowledge ought to be proved and referred to a system by philosophy. All truths demand proof ; that is to say, a deduction from superior principles ; except the highest truths of all, which cannot be demonstrated. Philosophy, then, as a science, is founded on something *directly* true and certain, and on the agreement between what is concluded, and that which is self-evident and self-established. Reason is the highest and ultimate source of all moral certainty.

46. But before the Understanding can arrive at a thorough comprehension of itself, it must pass through many intermediate degrees of improvement ; and in this transition-state, being as yet ignorant of the ultimate

principle of knowledge, and not seeking it in that direction, in which alone it can be found (*viz.* in the *mind* instead of *external objects*, in the *subject* instead of the *object*), ends in mistaking for it something inferior and subordinate; pursues certainty beyond the limits of reason; commits innumerable errors in the demonstration of philosophical knowledge; pretends to investigate matters beyond its range; and thus ends in opposition to itself.

49. The enlightened activity of the understanding, which, when properly cultivated, we call Philosophy (§ 2), presupposes in its turn attention, reflection, and abstraction. These are faculties which manifest themselves in various degrees, proportioned to the diversity of intellectual powers.

50. The causes which influence the development of reason are: the constitution of the human understanding; certain desires, doubts, sentiments, and perceptions of the mind; acquired knowledge; curiosity; emulation, resulting from the number and the diversity of persons engaged in the same pursuit; the influence of genius; example; encouragement; and the free communication of thought.

51. Previously to the scientific investigation of the principles, the laws, and the ends of phenomena presented to it, the human mind in some sort imagines, or, as it were, divines them; and this imagination conforms itself to the laws of the fancy; assimilating and personifying. It is thus that man, in a state of nature, conceives of all things as living and resembling himself. There is vaguely presented to his thoughts a world of spirits, at first without laws; afterwards, under the empire of a law foreign and external (Fate). He conceives an idea of unity and harmony, less at first in the internal world than the external; less in the whole than the parts; less by reflection than by a poetic creation (his fancy finding objects for the conceptions of his understanding); and thus advances

from a capricious indulgence of the imagination to the exercise of legitimate thought.

52. The development of the understanding begins with a sentiment of religion. The more that man by reflection extends and enlarges the sphere of his consciousness, the more he elevates himself, with regard to the object of his veneration, from sensation to mental conception, and from opinions to general ideas. The human mind investigates the principle of its religious belief, first of all *without*, in the *object*; subsequently *within*, in the intellectual *subject*.

53. It is thus that man advances, from a state of consciousness, obscure and imperfect, to an enlightened knowledge; from poetry to reason; from a blind to a rational faith; from individual to universal. It is thus that guided by an obscure sentiment of truth, of harmony, of analogy, he prosecutes the pursuit of something *certain* and *necessary*; to which may be referred all the points of belief which have attracted his attention; and which may establish the certainty of them. It is thus that he attempts philosophy, at first to satisfy his own mind; afterwards, with a more general view, for the advancement of Reason itself. In the natural order of her progress, Philosophy apprehends at first the *complex* objects of the world without, which are of a nature to excite in a lively manner its attention; subsequently, it advances by degrees to objects more difficult of apprehension, more obscure, more internal, and more simple.

*Observation.* This progress may be observed to obtain in a greater or less degree, and with different modifications, among all nations. There is, however, this difference, that only a few have elevated the philosophy of the human mind to the rank of a formal science;—whence proceeds this difference?

54. Philosophy, when it has assumed a scientific character, has a tendency by the investigation of causes, of the laws, and the ultimate ends of things, to constitute

human knowledge as an integral system, independent, and fundamentally established (§ 2 and 44). Such is the task of philosophical reason; but we must also distinguish the differences which exist in its *aim*, *method*, and *results*.

55. As to its *aim*, philosophy may be influenced by a solitary and partial curiosity, confined to one point of view, or stimulated by a more liberal and scientific interest, at once practical and theoretical. As to *method* it proceeds (on general topics) either from principles to consequences (the *synthetic* order); or from consequences to principles (the *analytic* order); and (in special matter), as far as relates to the starting point of its researches, it advances, either, from a complete and profound inquiry into the nature of our faculties for knowledge to the knowledge itself of things; or from the knowledge of things to the theory of knowledge. This last method of proceeding is called, since the time of Kant, the *Dogmatic* method, or *Dogmatism*; the other, the *Critical* method.

56. The *non-critical* philosophy has for its aim to establish certain points of doctrine (*dogmata*), or to destroy the *dogmatic* opinions of others; in which latter case it has the tendency, as it does not substitute other principles for those which it removes, to establish uncertainty and doubt as most consistent with reason. The first of these two schools ends in dogmatism *positive*; the second in scepticism, or dogmatism *negative*.

57. Dogmatism pretends, either, that human reason is, of itself, capable of attaining to a knowledge of the laws and the nature of things; or, that it cannot attain thereto without a superior instruction and guidance. The first of these doctrines is *Naturalism*, or *Rationalism*, in its most extended signification; the other is *Supernaturalism*.

58. *Rationalism*, in the most extended signification of

the word, proceeds sometimes upon knowledge, sometimes (like that of *Jacobi*), upon belief; and either demonstrates the truth of our impressions and knowledge, by the reality of the objects; or, contrariwise, the reality of the objects, by the certainty of the impressions. In the first of these cases we have *realism*, which takes for its principle the reality of things; in the second case we have *idealism*, which takes for its foundation the certainty of our ideas; while many philosophical systems, on the other hand, pretend that there is an original identity of knowledge with its object.

59. Dogmatism, with reference to the *means* of acquiring knowledge, is either *Sensualism*, or *Rationalism* in a more restricted sense; or compounded of both. As far as relates to the *origin* of knowledge, dogmatism becomes either *Empirism* (otherwise called *Experimentalism*), or *Noologism*; or compounded of both. Lastly, with reference to the *number* of fundamental principles, it becomes *Dualism* or *Monism*; and to this last description belong both *Materialism* and *Spiritualism*, as well as the system of Absolute Identity.

60. Supernaturalism not only asserts that the Deity is the active principle of all that exists, but also that revelation is the source of all truth; thus referring all knowledge to a supernatural source, unattainable by the steps of science. There are diversities in this system according to the manner in which revelation is considered relatively to its subject or its object; as universal or particular; and as superior or subordinate to reason; or co-ordinate with it.

*Observation.* Supernaturalism has this in common with scepticism, that it lays great stress on the false pretensions and the inefficiency of reason.

61. Scepticism is opposed to dogmatism, inasmuch as it seeks to diminish the confidence of reason in the success of its efforts. It uses as arguments the errors which are

often with justice imputed to dogmatism, or alleges certain formal propositions of its own, relative to the end and the principles of knowledge. It is, therefore, the perpetual antagonist of dogmatism; but in disputing the pretensions to which knowledge lays claim, it proceeds even to deny its existence and destroy it altogether. Scepticism is sometimes universal, sometimes particular, and has been the precursor of the critical method, which leads to the true science of reason.

62. The *result* of philosophic research is a system of philosophy; that is to say, a collection of philosophical information drawn from philosophical principles, and of this there can be only one true system, which is that *ideal* of the science reason perpetually aims at (§ 2). But the various attempts of individual thinkers to attain thereto have given occasion to a number of systems, which approximate this *ideal object* in proportion to the knowledge they evince of the true end and principles of philosophy,—to the extent of information they convey,—the validity of the reasoning they contain, and the accuracy of their technical language (cf. § 3).

*Observation.* Until a more complete examination of the powers of the understanding shall have been instituted, and a more extensive analysis of the faculty of knowledge, systems of philosophy must inevitably contain a mixture of *universal* and *particular*, of *true* and *false*, of *determinate* and *indeterminate*, of *objective* and *subjective*.

63. These different systems are opposed to each other and to scepticism. The consequence has been a contest which we see carried on with a greater or less degree of ardour, maintained by the love of truth, and too frequently also by private interests and passions; until at last either *indifference*, or a revolution in the spirit of philosophy, or the acuteness of logicians and critics put an end to it, for the time, and introduced a more liberal system of inquiry.

64. More than one system has figured upon the stage in various dresses, and certain philosophical questions have frequently been repeated under different forms. These apparent reiterations do not, however, prove that philosophy has been retarded in its progress; the repetition of old ideas does not render its advance towards new ones more tardy, but only more sure. By this very circumstance analysis is rendered more exact and more complete; and the search after unity, consistency, and perfection, more accurate and profound. The character and the attributes of science are more completely developed, are better understood,—better appreciated;—errors and unfounded theories more cautiously avoided.

65. But, with all these retrogradations and moments of apparent relaxation, advancement is impossible except by the aid of a sustained zeal for philosophical investigation. This science demands a perpetual agitation of doubts and discussions; of controversy between dogmatism and scepticism, between the partizans of ancient systems and of modern ideas.

## PARTICULAR INTRODUCTION.

---

### RAPID REVIEW OF THE RELIGIOUS AND PHILOSOPHICAL OPINIONS OF THE ORIENTAL NATIONS, AND OF THE FIRST PERIODS OF GRECIAN CIVILIZATION.

To this head belong the works on the religions and the discoveries of the East at large; some of which, for example those of *Plessing*, have been noticed above, § 38; see, besides, the mythological treatises, such as :

† FR. CREUZER, Symbolical and Mythological System of the Ancients, etc. 4 vols. *Leips.* and *Darmstadt*, 1810-12, second edition, 1820 (and following years), 5 vols. 8vo.

† J. GÖRRES, History of the Fables of the Asiatic World, 2 vols. *Heidelb.* 1810, 8vo.

† J. J. WAGNER, Ideas towards an Universal Mythology of the Ancient World, *Francfort on the M.* 1808, 8vo.

† J. G. RHODE, On the Age and Merit of certain Records of Oriental Antiquity, *Berlin*, 1817-18. And Memoirs towards illustrating the science of Antiquities, No. I, *Berlin*, 1819, No. II, 1820, 8vo.

Particularly a dissertation in No. I, on the most Ancient Religious Systems of the East.

L. C. BAUR, Symbolical and Mythological Systems, 2 parts, *Stuttg.* 1825, 8vo.

66. Instruction was in part conveyed by the nations of Asia to the Greeks, and the latter had gone through many gradations of intellectual improvement before the epoch when a philosophical spirit was awakened among them. Accordingly, it may not be foreign to our purpose to give a rapid sketch of the religious and philosophical

opinions of the oriental nations, as well as of the first advances of intellectual improvement among the Greeks, in order to be enabled to estimate, at least *generally*, the influence which the former may have had over Grecian genius in its infancy; and consequently over *philosophy* itself, in its *manner* as well as its *matter*. The Hindoos, the Persians, the Chaldeans, the Egyptians, and the Phoenicians, are the principal nations with whom the Greeks have had any intercourse <sup>a</sup>.

### *Hindustan.*

Authorities: The sacred books of the Hindoos, the *Schasters*, and particularly the *Vedams*, whereto belong the *Upanishadas* (fragments of the *Oupnek'hat*), and the *Puranams*, to which belong the ancient national poems; *Ramayana* (*Serampore*, 1806-10, 3 vols. 4to. a new edition by A. W. SCHLEGEL),—*Mahabharata*—and the *Dersanas*.

BHAGUAT-GEETA, or Dialogues of Chrishna and Ardjoon in eighteen lectures, with notes, translated from the original Sanscrit by CH. WILKINS, *Lond.* 1785, 4to.

BAGAVADAM, ou Doctrine Divine; ouvrage Indien Canonique sur l'Etre Suprême, les Dieux, les Géans, les Hommes, les diverses parties de l'Univers (par OPSONVILLE), *Paris*, 1788, 8vo.

L'EZOUR VEDAM, ou ancien Commentaire du Vedam, contenant l'exposition des Opinions religieuses et philosophiques des Indiens, traduit du Samskretan par un Brahme; revu et publié avec des observations préliminaires, des notes, et des éclaircissements, *Yverdun*, 1778, 2 vols. 12mo. (The introduction, On the Wisdom of the Hindoos, is by SAINTE-CROIX <sup>b</sup>).

Theologia et Philosophia Indica s. Oupnek'hat id est secretum tegenedum, stud. et op. ANQUETIL DU PERRON, *Argent*, 1801-2, 2 vols. 4to. (Deutsch im Auszuge von THAD. ANSELM RIXNER, *Nürnberg*, 1808, 8vo.)

† W. VON HUMBOLDT, on the Bhagavad-Gita, *Berlin*, 1826.

AMBERTKEND, a work on the Nature of the Soul; an account of it by DE GUIGNES in the *Mém. de l'Acad. des Inscript.* tom. XXVI.

MUNAVA DHARMASASTRA (English), with a preface by Sir W. JONES, *Lond.* 1796.

PRABOD'H CHANDRO'DAYA, Or the Moon of Intellect, an alle-

<sup>a</sup> On the general character of thought in the East, see above, § 19.

<sup>b</sup> Consult however † SCHLEGEL's *Ind. Biblioth.* II, 50.

goric Drama : and *ATMA Bod'h*, or the Knowledge of Spirit, etc. ; translated from the Sanscrit and Pracrit by J. TAYLOR, 1812, 8vo.

† REMMOHON-ROY, *Jena*, 1817.

Ctesiae Indicorum fragmenta ; Strabo ; Arrianus De Exped. Alexandri ; Palladius De gentibus Indiae et Brachmanibus ; Ambrosius De moribus Brachmanum, et alius anonymus de iisdem, junctim editi curâ, ED. BISSÆI, *Lond.* 1668, 4to.

Specimen sapientiae Indorum veterum, Græcè ex cod. Holst. cum vers. Lat. ed. SEB. GFR. STARK, *Berol.* 1697, 8vo.

ALEX. DOW, History of Hindostan, from the earliest account of time to the death of Akbar, translated from the Persian of MUHAMMED CASIM FERISHTA, *Lond.* 1768, 3 vols. 4to. (With a learned Dissertation prefixed, concerning the Language, Manners, and Customs of the Hindoos.)

J. JAC. HOLWELL, Interesting historical Events relative to the Provinces of Bengal and the Empire of Hindostan, *Lond.* 1766, 3 vols. 8vo.

SINNER, Essai sur les dogmes de la Métempsychose et du Purgatoire, enseignés par les Brahmins de l'Indostan, *Berne*, 1771, 8vo.

Asiatic Researches. *Calcutta* ; from 1788 ; several volumes.

The Dissertations and Miscellanies relative to the History of the Antiquities, Arts, Sciences, and Literature of Asia, by Sir W. JONES and others, have been extracted from the last volumes of the foregoing collection, *Lond.* 1792-8, 4 vols. 8vo.

Systema Brachmanicum liturgicum, mythologicum, civile ex monumentis Indicis musæi Borgiani Velitris dissertationibus historico-criticis illustravit FR. PAULINUS a S. BARTHOLOMÆO, *Romæ*, 1791, 4to.

W. WARD, A View of the History, Literature, and Religion of the Hindoos, *Lond.* 1817-20. 4 vols. Particularly vol. IV.

† ARN. HERM. LUDW. HEEREN, On the Indians ; (Suppl. to the third edition of his work, *Ideen über die Politic*, etc. s. 444), *Götting*. 1815-27, 8vo.

† NIC. MÜLLER, Opinions, Arts, and Sciences, of the ancient Hindoos, *Mentz*, 1822, 8vo.

LAUNJUINAIS, La Religion des Indous selon les Vedah, ou Analyse de l'Oupnek'hat publié par ANQ. DU PERRON, *Paris*, 1823, 8vo. See also his Memoirs on the Literature, Philosophy, etc. of the Hindoos.

† OTHM. FRANKS, On the Hindoos, and their Literature, etc. *Leips*. 1826, 8vo.

† J. G. RHODE, on the same subject, *Leips*. 1827, 2 vols. 8vo.

67. The Hindoos early distinguished themselves for arts, industry, civilization, and science; but the commencement of their history is, even yet, involved in great obscurity, and lost in the wildest traditions and chronological pretensions. Nothing has, even yet, been positively decided on the question whether their civilization and sciences be indigenous or derived from others; nor yet, whether they may not have blended certain notions either directly or indirectly borrowed from foreign nations, with others which were properly their own. The same uncertainty prevails with respect to the age attributable to their sacred books.

Of the four *castes* into which the nation is divided, the first consists of the priests (Brahmins); subdivided into a great number of sects, and modified by various revolutions. The compulsory emigration of many Brahminical tribes has carried their religious opinions into the adjacent countries of Siam, China, and Tartary.

The supreme being of the Hindoos is Brahma, incomprehensible by any human understanding; pervading and vivifying all things. Originally, he reposed in the contemplation of himself; subsequently, his creative word has caused all things to proceed from him, by a succession of continual emanations. As creator, he is named *Brahma*; as the preserving power, *Vishnou*; as the destroyer and renovator of the forms of matter, *Siva*. These three relations of the divine being constitute the Trinity (*Timourti*) of the Hindoos. The innumerable transform-

ations of Vishnou, or incarnations of the ~~divine~~ being, form the principal subject of their sacred books. Connected with this doctrine of *emanation* is that of the pre-existence of souls; their derivation from the divine nature; their immortality; their fall; and the purification of fallen spirits by successive migrations through the corporeal world.—(Doctrine of the migration of ~~souls~~ or Metempsychosis).

Subsequently, the religion and philosophy of the Hindoos was split into two sects—of Brahmissm and Buddhism. In consequence of this we find, both in their sacred books and among the Brahmins, the greatest discrepancy of opinion to prevail respecting God, the world, and the soul: that is to say, we find both *realism* and *idealism*; *theism* and *atheism*; *materialism* and *spiritualism*. These doctrines are for the most part propounded in the form of instruction, delivered by men professing to be enlightened from above<sup>c</sup>. Though obscured by poetic imagery, we detect throughout, the workings of an acute and ingenious spirit, which made some sort of advance towards correct reasoning. After all, the true systematic and scientific genius of philosophy must not be expected in these works. Their books of moral precepts have a character of nobleness and gentleness which belong to the race; and are, in a great measure, framed in accordance with the doctrine of the migration of souls. In the religion of Buddha, to which belong the Siamese, the Talapoins, and the Bonzes, the supreme felicity of God, and of the human soul, is made to consist in a state of absolute indifference and inaction.

### *Thibet.*

Besides some works enumerated § 66, consult *Alphabetum Tibetanum*, auct. AUG. ANT. GEORGIO, *Romæ*, 1762, 8vo. MAYER has given an extract from it in his *Lexicon*.

<sup>c</sup> See, concerning the Gymnosophists, *Cic. Tusc. V*, 27; concerning Menon-Capila, Buddha, Calanus, *Cic. de Div. I*, 23; *Tusc. II*, 22.

† P. S. PALLAS, Collection of Historical details respecting the Mogul nations, *Petersburgh*, 1776-1803, 4to.

† HÜLLMANN, Critical Researches respecting the Lamaic Religion, *Berlin*, 1796, 8vo.

68. Like the Hindoos, the Thibetians believe in a God who reveals himself in a threefold relation and form; and suppose a great number of transformations of this deity, principally in his *second* character. They have, besides, various traditions respecting the origin of all things; respecting spirits, and their descent into the visible world; also with regard to the different epochs of the world, and the migration of souls.

### *Chinese.*

Sinensis imperii libri classici sex e Sinico idiomate in Lat. trad. a P. FRANC. NOEL, *Prag*. 1711, 4to.

† The Chou-King, one of the sacred books of the Chinese, translated by FATHER GAUBIL, revised and compared with the Chinese by M. DE GUIGNES; with a notice concerning Y-King, another sacred book of the Chinese, *Paris*, 1770, 4to.

† A Treatise on some points of the Chinese Religion, by FATHER LONGOBARD. Furthermore, A Treatise on some important points relative to the Mission to China, by FATHER SAINTE-MARIE; with Letters of M. DE LEIBNITZ on the Chinese Philosophy. These three works are contained in Leibnitzii Epist. ed. KORTHOLT, 2 vols.

CONFUCIUS Sinarum Philosophus sive scientia Sinensis Lat. exposita studio et op. PROSPERI JUONETTA, CHRIST. HERDTRICH, FRANC. ROUGEMONT, PHIL. COUPLET, P. P. Soc. Jesu, *Paris*, 1687, folio.

The works of CONFUCIUS, containing the original text, with a translation by MARSHMAN, *Serampore*, 1809, 4to.

Historia Philosophiæ Sinensis, etc. *Bruns*. 1727, 4to.

KLAPROTH, Mémoires Relatifs à l'Asie (*Asiat. Magaz.* from 1810).

MORRISON, On Chinese Literature (in the *Asiatic Journal*).

ABEL REMUSAT, *Journal Asiatique*, vol. I, July 1823, p. 3. Consult also WINDISCHMANN, in the first vol. of his work, *Philosophie im Fortgange der Geschichte*.

69. The *popular* religion of the Chinese (which was that of their most remote ancestors), consists in adoration of the heavens, the stars, and the powers of nature personified, with certain superstitious notions, of more recent date, respecting astrology, the demons, and magic. *Lao-Kiun* and *Fo*<sup>d</sup> mixed up these religious opinions (which they did not correct), with some philosophical ones. *Koung-fu-tzé* (*Confucius*), about 550 B.C., collected the traditions belonging to both these personages; new-modelled the laws; and gave excellent moral precepts. It is very remarkable that his writings contain no trace of a recognition of the existence of a Supreme Being, or of the immortality of the soul. *Mung-chee*, or *Meng-dseu* (*Memcius*) enlarged upon the doctrines of Confucius. A variety of opinions migrated from India and from Thibet into China. The improvement of science among them has for many hundred years been inconsiderable. (For what reason?)—The Japanese entertain similar doctrines.

### *Persians.*

On the Authenticity of the books of Zend consult also, † BUHLE, *Manual of the History of Philosophy*; † ZOEGA, *Dissertations* published by WELCKER; VALENTIA, *Travels*; and ERSKINE, *Dissertation on the Parsees*, in the second vol. of the *Literary Society of Bombay*.

70. In the times of the Greeks, the religion of the Persians (*Parsees*) consisted in the adoration of the heavenly bodies (*Sabeism*), especially the sun; and of the powers of nature. The priests were called Magi. Zoroaster (*Serduscht*), a Mede by birth, reformed the religion of the Medes, which, originally confined to the worship of fire, had been modified to the worship of the sun and the planets. This worship survives to the present day in India among the Parsees, who were driven out of Persia by the Mahometans; and who pretend to be still in possession of the sacred books of Zoroaster. This philosopher lived in the time of Gushtasb (*Darius Hystaspis*). He asserts the existence of a supreme being, all-powerful and eternal (*Zeruane Akerene*, i. e. *infinite time*), from whom have eternally proceeded, by his creative word (*Honofer*), two principles, *Ormuzd* and *Ahriman*; Ormuzd (*Oromasdes*), being pure and infinite Light, Wisdom, and Perfection, the Creator of every good thing; Ahriman the principle of darkness and evil, opposed to Ormuzd, either originally, or in consequence of his fall. To this belief are attached fables respecting the conflicting efforts and creations of these two powers; on the universal dominion ultimately reserved for the good principle, and the return of Ahriman during four periods, each of which is to last three thousand years;—on the good and the evil spirits (*Amshaspands*, *Izeds*, *Ferfers*<sup>e</sup>, and *Deves*), and their differences of sex and rank;—on the souls of men (*Ferfers*), which, created by Ormuzd before their union with the body, have their habitation in the heavens; and which ultimately, according as in this world they have served Ormuzd or Ahriman, pass after death into the dwellings of the blessed, or are precipitated into obscurity:—finally, respecting the future resurrection of the bodies of the wicked after the victory of Ormuzd and the restoration of all things. Such, with some ascetic precepts, are the leading subjects of their sacred books. The doctrines of Zoroaster had an extensive influence owing to the principles of demonology and magic.

<sup>e</sup> These have been compared to the *Ideas* of the Platonists.

*Chaldeans.*

Authorities: The Scriptures, Diodorus Siculus, II, 29; Strabo, XVI, p. 739, ed. CASAUB.; Sext. Emp. adv. Math. lib. V.; Cic. de Div. I, 1, 41; II, 46, sqq.

BEROSI Chaldaica, in the work of SCALIGER, De Emendatione temporum; and in FABRIC. Bibl. gr. t. XIV, p. 175; and the work itself (probably not authentic), entitled, Antiquitates totius Orbis; published in FR. JO. ANNI, Antiquitt. Varr. vol. XVII, Romæ, 1798 (and subsequently).

JO. JAC. WAGNER's Works before referred to.

71. The Chaldeans were devoted to the worship of the stars and to astrology: the nature of their climate and their country disposing them to it. The worship of the stars was revived by them and widely disseminated, even subsequently to the Christian era, under the name of *Sabeism*. The learned caste, which appropriated to itself the appellation of Chaldeans, had collected a certain number of astrological facts, and carried to a great length the delusive science of astrology. Under the empire of the Persians, this caste lost much of its credit, through the influence of the Magi, and ceased to attempt any thing but common place tricks of divination. The cosmogony of Berossus<sup>†</sup>, and the pretended Chaldean oracles (allowed to be apocryphal), are evidently the productions of another age and country. The principal divinity of this nation was called *Bel*. The fables related of him by the pretended Berossus do not deserve recital.

*Ægyptians.*

72. The Egyptians were a nation highly remarkable for the antiquity of their civilization, and the originality of all their social system. Their priests, who formed a separate caste, were the sole depositaries of the secrets of certain sacred books written in hieroglyphics<sup>s</sup>. It is very

<sup>s</sup> See † HEEREN, Thoughts on the Policy, Commerce, etc. of the Ancients;

difficult to determine with certainty, owing to the want of existing records, in what consisted their mysterious knowledge (*Esoteric* doctrine). It probably had a reference to the popular religion (*Exoteric* doctrine), which authorised the worship of the constellations (*Sabeism*); and that of certain animals (*Fetichism*), as symbolical of the former; of certain deified heroes (Thaut or Thot, Hermes, Horus); and lastly, maintained the doctrine of the Metempsychosis<sup>b</sup>. Their divinities Isis and Osiris, represented two principles, male and female. The peculiar character of the country seems to have given rise to, and encouraged, as the principal sciences of the Egyptians, geometry and astronomy; to which was united astrology and other superstitions, highly popular with the people at large. It is impossible to define with accuracy the progress which the priests may have made in the above sciences; but, previous to their intercourse with the Greeks, we cannot conclude them to have been possessed of any high degree of mental cultivation.

After the foundation of the Græco-Egyptian kingdom, the civilization of the two races was combined, and this circumstance renders yet more difficult any explanation of the mysteries of the ancient esoteric doctrines, and the former habits of the original inhabitants.

74. The Phœnicians, a commercial people, served,

through their continual intercourse with other nations, to disseminate widely a knowledge of the discoveries effected in the arts and sciences. Nevertheless, their mercantile habits restricted<sup>a</sup> their own knowledge to the maritime art and the mathematics. The history and the doctrines of Sanchoniatho<sup>o</sup> and of Ochus (Mochus, Moschus), are, at the present time, matters of much dispute. The cosmogonies attributed to them, as well as the popular religion of the Phœnicians, are eminently *material*. Posidonius, the Stoic, cites Moschus as the first inventor of the doctrine of atoms. See SEXT. EMPIR. adv. Mathem. IX, 363, and STRABO, Geog. XVI, p. 757.

75. Greece was gradually rescued from barbarism, and advanced to a state of civilization, by the means of foreigners. Colonies from Egypt, Phœnicia, and Phrygia, introduced inventions and arts, such as agriculture, music, religious hymns, fabulous poems, and mysteries. It cannot be doubted that, in like manner, a great number of re-

<sup>a</sup> PLATO, De Repub. IV, p. 359.

<sup>o</sup> About 1200 B. C (?).

ligious opinions and ideas must have migrated from Egypt to Greece. The only question is the degree of influence we should allow to these adventitious materials, the manner in which they became naturalized in their new country, and how far they were lost, or not, in the civilization and mental culture which they contributed to form. It is true that the Greeks possessed not only a rare aptitude for literature, but also a high degree of intellectual originality, the consequence of which necessarily was, that whatever they acquired from foreign nations speedily assumed among them a new and original character; the more so, because there was no sacerdotal race, no division into castes, no despotic authority to obstruct the advances of society and the development of the mental powers.

The religion of the Greeks, notwithstanding the *sensible* forms which it assumed in most of its mythi (the meaning of which was indeterminate), presented a subject-matter to engage and exercise the curiosity of the human mind. The poets laid hold on these materials, and employed them with unrivalled success. By these latter a sort of national education was established, addressing itself in part to the understanding, in part to the senses, which served as an introduction to scientific pursuits. Among those who in this respect exerted the greatest influence, was *Orpheus*<sup>1</sup>; by his religious hymns, his imaginations respecting cosmogony; by the introduction of mysteries, and by certain moral precepts<sup>m</sup>. *Musæus*, by his poetic description of the region of the dead,—Homer<sup>n</sup>, by his national epic

76. In the legislative systems of the Greeks, particularly those of Lycurgus, Zaleucus, Charondas, and Solon, we observe a high sense of liberty, a profound observation of the human heart, and great political prudence and experience. The sentences of the Seven Wise Men<sup>a</sup>, and the ancient Gnostic poets, contain, it is true, nothing more than rules of practical wisdom, expressed with energy and conciseness; but they evince, even at this early period, an advancement in civilization, and a ripeness of intellect for the pursuits of science; whenever an occasion should present itself to facilitate their prosecution.

# PART THE FIRST.

## FIRST PERIOD.

---

### GREEK AND ROMAN PHILOSOPHY.

FROM THALES TO JOHN OF DAMASCUS; i. e. FROM  
600 YEARS B. C. TO THE END OF THE EIGHTH  
CENTURY.

*Progress of the understanding towards knowledge, but without a clear perception of the principles which should direct it.*

77. The Greeks, who had derived from foreigners the first seeds of civilization, distinguished themselves above all the other nations of antiquity, by their taste for poetry, for the arts and sciences. The position of their country, their religion, their political constitution, and their love of liberty, contributed to develop, in all its originality and grandeur, the native genius of their country. They thus were betimes matured for philosophy, and engaged in the pursuit of it, even from the earliest date of their political liberty (§ 75).

78. A philosophical spirit having been once awakened among the Greeks, continued to extend its dominion. They devoted their attention to the most important objects of science (theoretically and practically); introduced method into their researches, forming a system of scepticism in opposition to dogmatism, and rarely failing to apply these speculative inquiries to purposes of real life. The wise men of Greece have justly been regarded by succeeding ages as models; as well for their spirit of research and investigation, as for the results to which these

have led, both in the *manner* and the *matter* of their philosophic inquiries ; but above all for a certain character of elegance and urbanity, and a command of philosophical language, which satisfies at once the judgment and the taste.

79. Their philosophy did not arrive at this perfection at once ; it began by disjointed speculations on the external world. The habit of reflection which grew out of these first essays ; the diversity of the results at which they arrived ; and the continually increasing sense of a want of unity and harmony in their conclusions, recalled wandering speculation to the contemplation of the human mind, as the ultimate source of all certain knowledge ; and philosophy became more enlarged, more methodical, and more systematic. In after times, the discord of different systems ; the prevalence of a subtile scepticism ; the oppression of the understanding under a load of historical erudition, eventually diverted the mind from the investigation of its own properties ; till the philosophers of Greece, having borrowed from those of the East some of their opinions, in the hope of attaining to something like *positive* knowledge, fell, instead, into *syncretism* and *mysticism*<sup>a</sup>. It is true that the passionate enthusiasm which mixed itself up with this later philosophy, belonged in part to the natural character of the Greeks.

80. The history of Grecian philosophy may, therefore, be divided into three periods analogous to the ages of man ; his youth—his maturity—and his decrepitude. Period the first : an ardent spirit of speculation, but with limited views and deficient in system ; from *Thales* to *Socrates*, i. e. from 600 to 400 B. C. Period the second : a spirit of inquiry more universal, more systematic ; both *dogmatical* and *sceptical* ; from *Socrates* to the union of the Porch and the Academy, i. e. from 400 to 60 B. C. Pe-

<sup>a</sup> [The force of these terms, as used by the author, will be sufficiently explained in the course of the work. *Trans.*]

riod the third: cultivation of Greek philosophy by the Jews and the Romans, and its declension; philosophical learning, without a philosophical spirit; sceptical speculations under a more learned aspect, but speedily lost in mystical and enthusiastical fancies, and destroyed by the union of Grecian literature with that of the Orientals. Prevalence of Christianity, from *Ænesidemus* to John of Damascus; i. e. from the year 60 B. C. to the eighth century<sup>a</sup>.

*Authorities for the history of Grecian philosophy.*

81. These are twofold; direct and indirect. The first are the works of the philosophers themselves, of which only a portion have come down to us entire, and for the most part consist of unconnected fragments, which have inflicted on the learned a prodigious deal of labour to arrange and illustrate them. The *indirect* sources consist in notices and information respecting the lives, the doctrines, and labours of the philosophers, which are to be found in subsequent writers of whatever description; whether presented to us in detached and unconnected pieces, or in a more complete form, and with a systematic arrangement. To this class belong: 1st. The writings of philosophers which contain accounts of the theories of their predecessors; among others, the works of Plato, Aristotle, Cicero (§ 180), Seneca, Plutarch (§ 185), Sextus Empiricus (§ 189, sqq.), Simplicius (§ 220). 2dly. The collections of Diogenes Laertius<sup>b</sup>, Philostratus<sup>c</sup>, Eunapius<sup>d</sup>,

See also the works enumerated above, § 75, on the Greek Mythology, particularly on ORPHEUS, HOMER, and HESIOD, and the Gnostic poets.

82. A spirit of philosophical research first manifested itself in some rude attempts in Ionia, made at the period when this country, colonized from Greece, enjoyed the utmost prosperity. Thence it extended to some of the neighbouring colonies; subsequently into Magna Græcia, until the conquests of the Persians and the troubles of southern Italy compelled it to take refuge in Athens; from which, as a centre, intellectual civilization was disseminated, and, as it were, radiated over the whole of Greece.

83. The starting-point of philosophy was the question concerning the origin and the elementary principle of the world: the resolution of which was attempted after the *experimental* method by the *Ionic* school; and the *formal* method by the *Pythagoreans*. The *Eleatic* school opposed to each other the *experimental* and *intellectual* systems; which were combined by the *Atomistic* philosophers. Last of all came a *Sophistical* school, which threatened to destroy all belief, religious and moral.

But this progress of investigation was a sort of aide to a more scientific philosophy, which by and by led from the external *object* to the internal *subject*: the world without to the mind within. Philosophical

reflection, discarding poetical fictions, applied itself to practical purposes, by the discovery of moral and political apothegms, for a long time delivered in verse (*Gnomæ*, whence *philosophia gnomica* sive Sententiaria; cf. § 75-76). In theory, men wandered, went from one hypothesis to another, until, in the end, they endeavoured to substitute for these a system of metaphysical knowledge. The earliest philosophers were solitary, and without a school (Pythagoras nevertheless being an exception). Their notions were disseminated at first by oral tradition; subsequently by writings; which gradually disengaged themselves from poetic fictions.

† GOESS, On the System of Thales. See above, at the head of § 2.

85. *Thales* (600 B. C.), of Miletus, the most flourishing commercial city of Ionia, improved himself by travel, was possessed of some mathematical and astronomical knowledge, and was ranked by his fellow-citizens among

the Seven Sages. He was the first Grecian who discussed, on principles of reason, the origin of the world. *Water* (ὕδωρ), or humidity<sup>a</sup>, was in his opinion (formed in consequence of some experimental observations very partial in their nature) the original element (ἀρχή), whence all things proceeded<sup>b</sup>; and spirit, πνεῦμα, the impulsive principle. He observed the attractive power of the magnet and, consistently with his theory, supposed the stone to have a soul. Every thing is full of the divinity<sup>c</sup>. It is not exactly known in what manner Thales associated the spiritual parts of his system with his material principle. Accordingly, the discussions which his theism has occasioned commenced at a very early epoch<sup>d</sup>. Among other sentences, they attribute to him γνῶθι σεαυτόν.

### *Anaximander and Pherecydes.*

† See also the work of TIEDEMANN mentioned above, at the head of § 82, p. 172, sqq.

86. *Anaximander*<sup>e</sup>, a Milesian like Thales, and a friend of that philosopher, chose as the basis of his argument, on the same subject, not analogy, but an assumed philosophical principle. The primary essence he asserted to be *infinite* (ἄπειρον), comprehending all things, and *divine* (τὸ

<sup>a</sup> J. H. MÜLLER, De Aquâ, principio Thaletis, *Altd.* 1719, 4to.

<sup>b</sup> ARISTOT. Metaph. I, 3. De Cælo, II, 13.

<sup>d</sup> CICERO, De Nat. Deor. I, 10.

<sup>e</sup> About 610 B. C.

θεῖον), without, however, more exactly defining it<sup>f</sup>. According to some he attributed to this divine nature an essence altogether distinct from the elements; according to others, he made it something intermediate between water and air. It is only in infinity that the perpetual changes of things can take place; from infinity, opposites detach themselves by a perpetual movement, and in like manner continually return to the same. By this principle the heavens and the earth subsist: with respect to which Anaximander did not content himself with astronomical speculations only. Every thing which is contained in infinitude (τὸ ἄπειρον), is subject to change, itself being unchangeable<sup>g</sup>. Such also was the doctrine, with some slight differences, of his contemporary, (but younger than himself), Pherecydes of Syros; who recognised as the eternal principles of all things Jupiter (Ζεὺς or αἰθήρ), Time, and the Earth. It appears also that he attempted an account of the origin of the celestial bodies and of the human race, and that he believed the soul to be immortal<sup>h</sup>. Anaximander and Pherecydes were the first philosophers who committed their thoughts to writing.

### *Anaximenes.*

DAN. GROTHII (præs. J. ANDR. SCHMIDT), Diss. de Anaximenes Psychologiâ, Jen. 1689, 4to.

87. *Anaximenes*, of Miletus<sup>i</sup>, followed the doctrine of his friend and teacher Anaximander; but instead of the indeterminate ἄπειρον of the latter, certain observations, though partial and limited, on the origin of things and the nature of the soul, led him to regard the air (ἀήρ) as the primitive element<sup>k</sup>. In after time, *Diogenes* of *Apol-*

88. The difficulties which embarrass this part of history and demand the exercise of much critical discernment, are,—The want of authentic writings, the abundance of those which are apocryphal, the mystery which appears to involve every thing belonging to the person, the character, and views of Pythagoras and his society; the difficulty of discriminating between what was his own, and what was borrowed from the Egyptians, or may have proceeded from others of his school, and finally, the re-establishment of the same school at a later period, under different masters, and with somewhat different views.

89. Pythagoras was born at Samos<sup>1</sup>; and improved

<sup>1</sup> In 584, according to Meiners.

himself by his travels in Greece and Egypt<sup>m</sup>, and probably also by the lessons of Thales and Pherecydes, (whose disciple he is said to have been<sup>n</sup>), as well as by those of Anaximander. After having previously attempted to establish a school and a species of philosophical congregation, at Samos, he founded one (about 527) at Croto, in Italy, whence his school came to be called the *Italic*. Besides the improvement of the intellectual, moral, and religious capacities of man, this society had also considerable political influence; which circumstance occasioned the ruin of the society, about the year 500; and the death of its founder<sup>o</sup>. Pythagoras may justly be esteemed a man remarkable for his talents, his discoveries, the elevation of his ideas, and the authority he possessed over others; but the ancient Greeks and Romans invested him with something more than this, amounting to a sort of superstitious reverence. He was the first who assumed the name of *philosopher*. See CIC. Tusc. Quæst. V, 3, 4. DIOG. LAERT. VIII, 8, and I, 12.

90. He investigated the principles of the mathematical sciences; particularly of Arithmetic, Geometry, Music, and Astronomy; his discoveries in which are of themselves sufficient to immortalise his name. He ascribed an occult power to words and numbers<sup>p</sup>; and the science of arithmetic, which he considered as the key to the mathematics, he looked upon as containing also the essence of all philosophical knowledge<sup>q</sup>. From this principle he was led to adopt a sort of Mathematical Philosophy, which gave to his school also the name of *Mathematical*. We possess only fragments of the speculations of his school on these subjects; in which we are not enabled to distinguish the hand of the master from that of his disciples.

## § 91.

On the subject of the Pythagorean numbers, see JAC. BRUCKER, *Convenientia Numerorum Pythagoræ cum Ideis Platonis*, Miscell. Hist. Philos.

De Numerorum, quos Arabicos vocant, vera origine Pythagoricâ commentatur CONR. MANNERT. *Norimb.* 1801, 8vo.

† C. A. BRANDIS, On the Doctrine of Numbers of the Pythagoreans and Platonists (in the *Rhen. Mus. of Hist. Philos.* etc. 1828, No. II, s. 208).

AMAD. WENDT, De rerum principiis secundum Pythagoreos Comment. *Lips.* 1827, 8vo.

*Numbers* were defined by the Pythagoreans to be the principles (*αἰτίαι*) of all things<sup>9</sup>; this school being disposed by their mathematical studies to make the system of external things subordinate to that of numbers, agreeably to their axiom, μέμνησιν εἶναι τὰ ὄντα τῶν ἀριθμῶν<sup>†</sup>. Numbers are equal and unequal, ἀρτίοι and περιττοί; the elementary principle of the latter being *unity* (μονάς), that of the former duality (δυάς). Unequal numbers are limited and complete; equal ones unlimited and incomplete. The abstract principle then of all perfection is unity and limitation (τὸ πεπερασμένον); that of imperfection, duality, and indeterminateness (τὸ ἀπείρον). The ten elementary numbers which are represented in the *tetractys*<sup>‡</sup>, and which embrace a complete system of numeration, contain also the elements of a perfect system of nature. (See Arist. Met. I, 5). In this instance they applied the theory of numbers to explain the natures and substances of things, as, in others, to illustrate their formation and origin. But on this subject, we are acquainted only with subsequent essays, and belonging to a later school<sup>§</sup>.

J. GEO. MICHAELIS, Diss. de Tetracty Pythagoricâ, *Francof. ad Viad.* 1735. ERN. WEIGIL, Tetractys Pythagorica.

<sup>§</sup> SEXTUS, Adv. Mathem. X, 249, sqq.

like their predecessors, considered the world to be a harmonious whole (κόσμος); consisting, according to a system of Decades, of ten great bodies revolving around a common centre, agreeably to harmonious laws; whence the music of the spheres<sup>u</sup>, and their explanation of the symbolical lyre of Apollo. The centre, or central fire (the sun), in other words, the seat of Jupiter, Διὸς οἶκος φυλάκη, is the most perfect object in nature, the principle of heat, and consequently of life; penetrating and vivifying all things. According to the same system, the stars also are divinities; and even men, nay, the inferior animals have a sort of consanguinity with the Divine Being. They considered the *dæmones* as a race intermediate between gods and men, and attributed to them a considerable agency in dreams and divination; always, however, assigning as ultimate causes of all things, destiny and the deity. They ennobled their notion of the deity by the attribution of certain moral qualities, such as truth and beneficence<sup>x</sup>.

93. *Doctrine of the Soul.* The soul also is a number, and an emanation from the central fire<sup>y</sup>, resembling the constellations to which it is allied by its immortality and its constant activity; capable of combining with any body, and compelled by destiny to pass successively through several. This theory of the *metempsychosis*, borrowed (it is probable), from the Egyptians<sup>z</sup>, Pythagoras appears to have combined with the doctrine of moral Retribution. It is to the Pythagoreans we are indebted for

they made to consist in τὸ ἀντιπεπονθός; Friendship was made to consist in community of interests, and equality: self-murder was condemned by Pythagoras as a crime against the gods, and the virtue which he especially commended was self-command (καταρτυσις). But the attention of this school was principally engaged, and its disciples exercised in a species of ascetic morality, which pervaded all their system<sup>e</sup>.

95. We are acquainted with but a small portion of the writings of the old Pythagorean sect, and these are merely commentaries on the opinions of their master. The philosophers belonging to it were *Aristæus* of Croto, the successor and son-in-law of Pythagoras, according to Jamblichus<sup>f</sup>; *Teleuges* and *Mnesarchus*, sons of Pythagoras; *Alcmæon* of Croto, principally distinguished as a naturalist and physician; *Hippo* of Rhegium, and *Hippasus* of Metapontum; (these two last were allied to the Ionic school, by their doctrine of a fundamental and elementary principle of nature); *Ecphantus* of Syracuse, who inclined to the Atomic school; *Clinias*, the contemporary of Philolaus, and *Epicharmus* of Cos, the comedian, called also the Megarean and Sicilian, on account of his residence at those places. Nothing can be advanced with certainty concerning *Ocellus* the Lucanian<sup>g</sup>, and *Timæus* of Locri Epizephyrii, and on that account called Timæus the Locrian<sup>h</sup>. The work attributed to the latter<sup>i</sup> is nothing but an abstract of the Timæus of Plato,

<sup>e</sup> Several symbolical precepts are to be found apud PLUTARCH. De Pueror. Educ. fin.; and DIOG. LAERT. VIII, 17.

<sup>f</sup> Vita Pythag.

<sup>g</sup> Flourished about 496 B.C.

The same, in the † Bibl. Philol. of Gött., vol. I, No. I, p. 204; and † TIEDEMANN, Spirit of Speculative Philosophy, vol. I, p. 89.

<sup>i</sup> Περὶ τῆς τοῦ κόσμου ψυχῆς, printed in the Opusc. Myth. Phys. et Eth. of THOM. GALE, p. 539, sqq., and published by D'ARGENS, Berlin, 1763, 8vo. translated by BARDILI, in the Collection of FÜLLEBORN, No. IX, § 9. On this work, consult † TENNEMANN, System of the Philosophy of Plato, vol. I, p. 93.

and the authenticity of the treatise on the Universe<sup>k</sup>, attributed to Ocellus, is even more unquestionably apocryphal. Among the most distinguished Pythagoreans of a later period should be mentioned, *Archytas* of Tarentum<sup>l</sup>, a contemporary of Plato, and *Philolaus* of Croto, or Tarentum<sup>m</sup>; who became celebrated for his system of astronomy, and composed the first treatise of his school which was committed to writing<sup>n</sup>, entitled, “The Bacchæ, or Inspired Women<sup>o</sup>.”

96. The doctrine of Pythagoras had great influence with the most eminent philosophers of Greece, and, in particular, with Plato; from the impression it communicated to their speculations. Subsequently, however, it became the fashion to call Pythagorean all that Plato, Aristotle, and others after them, had added to the doctrines of Pythagoras; even opinions which they themselves had started; and to this medley of doctrines of various origin was superadded a mass of superstitions (§ 184).

<sup>k</sup> Περὶ τῆς τοῦ παντὸς φύσεως, first published in the Opusc. of TH. GALE, p. 99, sqq. The same, by BATTEUX, with the work of TIMÆUS, Par. 1768, 3 vols. 8vo; and also separately, by D’ARGENS, Berlin, 1792, 8vo; by ROTERMUND, Leips. 1794, 8vo; and lastly, by RUDOLPHI, Ocellus Lucanus de Rer. 97. All the philosophers, whom we have hitherto had occasion to mention, made *experience* the basis of their arguments, and consequently were led by the evidence of their senses to the consideration of the *contingent* and the *variable*: which it was their endeavour to reconcile with the *invariable* and *absolute*, by referring all to the same original. We are now called upon to observe the commencement, at Elea in Italy, of a school which boldly asserted that *experience* existed only in appearance: that the ideas of *movement* and *change* were unintelligible; and, by these doctrines, were led to derive all knowledge from the mind itself, as the only substantial foundation of Truth. The Deity they identified with the Universe.

All this amounted, as is obvious, to a species of *idealism* and *pantheism*<sup>P</sup>, which was imagined by four philosophers, with the private circumstances of whose lives we have not much acquaintance.

<sup>P</sup> *Idealism* is used to denote the theory which asserts the reality of our ideas, and from these argues the reality of external objects: *Pantheism* is the opinion that all Nature partakes of the divine essence.

*Xenophanes.*

† FÜLLEBORN, Xenophanes, Collection, fasc. I, § 3. See the works mentioned in the preceding §.

98. *Xenophanes* of Colophon was the contemporary of Pythagoras, and, about the year 536, established himself at Elea or Velia, in Magna Græcia. From the principle *ex nihilo nihil fit*, he concluded that nothing could pass from non-existence to existence. According to him, all things that really exist are eternal and immutable. On this principle he looked upon all nature as subject to the same law of unity; *ἐν τὸ ὄν καὶ πᾶν*. God, as being the most perfect essence, *τὸ πάντων ἄριστον καὶ κράτιστον*, is eternally, One; unalterable, and always consistent with himself; He is neither finite nor infinite, neither moveable nor immoveable; he cannot be represented under any human semblance; he is all hearing, all sight, and all thought, and his form is spherical. The same philosopher (on the principle of experience), proposed to explain the multifariousness of variable essences by assuming, as primitive elements, water and earth. He appears to have hesitated between the opposite systems of *empirism*<sup>a</sup> and *rationalism*, and bewailed the incertitude which he regarded as the condition of humanity<sup>r</sup>. Xenophanes was the first to set the example of a philosopher who divested the

<sup>a</sup> *Empirism*, or *experimentalism*, it is necessary to bear in mind, would derive all our knowledge from experiment, by the avenues of the senses: *rationalism*, on the contrary, from the mind.

† NIC. HIER. GUNDLING, Observations on the Philosophy of Parmenides, in the *GUNDLINGIANA*, tom. XV, p. 371, sqq.

† J. T. VAN DER KEMP, Parmenides, *Edinæ*, 1781, 8vo.

99. *Parmenides* of Elea, who travelled with Zeno to Athens about 460, enlarged upon the above system. He maintained that the understanding alone was capable of contemplating Truth; that the senses could afford only a deceptive *appearance* of it. From this principle he deduced a twofold system of *true* and of *apparent* knowledge; the one resulting from the understanding, the other from the senses<sup>b</sup>. His poem on Nature treated of both these systems; but the fragments of it which have come down to us make us better acquainted with the former than the latter. In the *former*, Parmenides begins with the idea of *pure existence*, which he identifies with *thought* and *knowledge*<sup>c</sup> (never expressly making it the same with the Deity), and concludes that *non-existence*, τὸ μὴ ὂν, cannot be possible; that all things which exist are one and identical; and consequently that existence has no commencement, is invariable, indivisible, pervades all space, and is limited only by itself; and consequently

<sup>a</sup> CLEM. ALEX. ed. POTT. p. 714, sqq.

<sup>b</sup> SEXTUS, Adv. Mathem. VII, 111. ARIST. Metaph. I, 5. DIOG. LAERT. IX, 22.

<sup>c</sup> See Frag. in FÜLLEBORN, V, 45, 46. 88—91. 93, sqq.

that all movement or change exists only in *appearance*<sup>\*</sup>. The *manner*, notwithstanding, in which objects present themselves to our senses is uniform, and is called *δόξα*. To account for this *appearance* conveyed by the senses, Parmenides assumed the existence of two principles, that of heat or light (ethereal fire), and that of cold or darkness (the earth); the first pervading and active, the second dense and heavy; the first he defined to be *positive, real*; and the *intellectual* element (*δημιουργός*); the second the *negative* element, or, *ἔλη*; or as he preferred to style it—a *limitation* of the former<sup>†</sup>. From this two-fold division he derived his doctrine of *changes*; which he applied even to the phenomena of the mind.

### *Melissus.*

ARISTOTELIS liber de Xenophane, Zenone, Gorgiâ, c. I, 2; et SPALDING Comment. ad h. lib. See Bibliogr. § 97; cf. DIOG. LAERT. lib. IX, § 24.

100. *Melissus* of Samos<sup>‡</sup>, adopted (possibly from the teaching of the two last philosophers) the same system of idealism, but characterized by greater boldness in his way of stating it, and, in some respects, by profounder views. What really existed, he maintained, could not either be produced or perish; it exists without having either commencement or end; infinite, (differing in this respect from Parmenides), and consequently, one, invulnerable, not composed of parts, and indivisible: which doctrine implies a denial of the existence of bodies, and of the dimensions of space. All that our senses present to

§ He was distinguished as a statesman and naval commander, and flourished about 444 B. C.

us (that is to say, the greater part of things which exist), is nothing more than an *appearance*, and is altogether beyond the limits of real knowledge<sup>b</sup>. As for the relation between real existence and the Deity, we are ignorant of the sentiments of Melissus on this head; for what is reported by Diog. Laert. IX, 24, can be considered as relating only to the *popular* notions.

### *Zeno.*

See the works mentioned in § 97.

DIET. TIEDEMANN, *Utrum Scepticus fuerit an Dogmaticus Zeno Eleates*; *Nova Bibliotheca Philol. et Crit.* vol. I, fasc. 2; cf. † STUADLIN, *Spirit of Scepticism*, vol. I, 264.

101. *Zeno* of Elea, an ardent lover of liberty<sup>c</sup>, travelled, with his friend and teacher Parmenides, to Athens, about the LXXX. Olympiad<sup>d</sup>, and appeared in the character of a defender of the idealism of the Eleatic school, which could not but seem to people at large strange and absurd; endeavouring, with great acuteness, to prove that the system of empiric realism is still more absurd<sup>e</sup>. 1st. Because if we admit that there is a plurality of real essences, we must admit them to possess qualities which are mutually destructive of each other, similitude, for example, and dissimilitude; unity and plurality; movement and repose<sup>f</sup>. 2dly. We cannot form an idea of the divisibility of an extended object without a contradiction being involved; for the parts must be either simple or compounded; in the first of which cases the body has no magnitude, and ceases to exist; in the second it has no unity, being at

<sup>b</sup> ARIST. *Phys.* I, 2, 3, 4; III, 9; *De Cœlo*, III, 1; *De Sophist. Elench.* 28. SIMPLIC. in *Physic. Arist.* p. 8 et 9. 22. 24, 25; in *Arist. de Cœlo*, p. 38, a. CIC. *Acad. Quæst.* II, 37. SEXT. *Emp. Pyrrh. Hyp.* III, 65; *Adv. Math.* X, 46. STOB. *Ecl.* I, p. 440.

<sup>c</sup> PLUTARCH. *Adv. Colot.* ed Reiske, vol. X, p. 630. DIOG. LAERT. IX, 25, sqq. VAL. MAX. III, 3.

<sup>f</sup> PLATO, *Phædr.* vol. III, p. 261. SIMPLIC. in *Phys. Arist.* p. 30.

the same time finite and infinite<sup>‡</sup>. 3dly. Innumerable difficulties result (according to Zeno) from the supposition of motion in space: if such motion be allowed to be possible, the consequence is, that infinite space must, in a given time, be traversed. He has acquired great celebrity by his four logical arguments against motion<sup>h</sup>, and particularly by the well-known one named Achilles<sup>i</sup>. 4thly. *We cannot form a notion of space as an object, without conceiving it to be situated in another space, and so on ad infinitum<sup>k</sup>*. And in general he denies that the absolute unity which the understanding requires as a character of real existence, is in any sort to be recognised in the objects of the senses<sup>l</sup>. By thus opposing reason to experience, Zeno opened the way to scepticism; at the same time laying the foundations of a system of logic, of which he was the first teacher<sup>m</sup>; and employing dialogue<sup>n</sup>.

102. The speculations of the Eleatæ (to which *Xenias* of Corinth<sup>o</sup>, also attached himself<sup>p</sup>), were subsequently pursued in the school of Megara. They did not fail to meet with opponents, but their real fallacy was not so readily discovered. Plato, by making a due distinction between ideas and their objects, approached the nearest to the truth.

CHR. GOTTLÖB HEYNE, Progr. de Animabus siccis ex Heracliteo placito optime ad sapientiam et virtutem instructis, *Götting.* 1781, fol.; and in his *Opusc. Acad.* vol. III.

† FR. SCHLEIERMACHER, Heraclitus of Ephesus, surnamed the Obscure; compiled from the fragments of his work, and the testimonies of ancient writers, in the third fasciculus of vol. I, of the *Musæum der Alterthumswissenschaften*, *Berl.* 1808, 8vo. Cf. the work of RITTER, p. 60, referred to above at the head of § 85; and, in answer to the views of Schleiermacher, THEOD. L. EICHHOFF, *Dissertationes Heracliteæ*, partic. I, *Mogunt.* 1824, 4to.

103. By his birth *Heraclitus* of Ephesus belonged to the Ionian school<sup>a</sup>. He was a profound thinker, of an inquisitive spirit; and the founder of a sect called after him, which had considerable reputation and influence. His humour was melancholy and sarcastic, which he indulged at the expense of the democracy established in his native town, and with which he was disgusted. The knowledge he had acquired of the systems of preceding philosophers (vying with one another in boldness), of Thales, Pythagoras, and Xenophanes<sup>r</sup>, created in him a habit of scepticism of which he afterwards cured himself. The result of his meditations was committed to a volume, the obscurity<sup>s</sup> of which procured for him the appellation of σκοτεινός<sup>t</sup>. He also made it his object to discover an elemental principle; but either because his views were different, or from a desire to oppose himself to the Eleatæ, he assumed it to be *fire*, because the most

<sup>a</sup> He flourished about 500 B. C.

<sup>r</sup> According to some, he was the disciple of this philosopher.

<sup>s</sup> This work is cited under different titles; e. g. *Μούσαι*, Fragments in HENR. STEPH. *Poes. Philos.* Cf. SCHLEIERMACHER.

<sup>t</sup> DIOG. LAER. IX, 5; et II, 22. ARIST. *Rhet.* III; *De Mundo* 5. CIC. *De Nat. Deor.* I, 26; III, 14; *De Fin.* II, 5.

subtile and active of the elements. *Fire* he asserted to be the foundation of all things, and the universal agent. The universe he maintained to be neither the work of gods nor men; but a *fire*, continually kept alive, but with alternations of decay and resuscitation, according to fixed laws<sup>u</sup>. Hence he appears to have deduced among others the following opinions: 1. The variability, or perpetual *flux* of things (πόη<sup>x</sup>), wherein also consists the *life* of animals<sup>y</sup>. 2. Their formation and dissolution by fire; the motion from above and from below; the first by evaporation, or ἀναθυμίασις; and the future conflagration of the universe<sup>z</sup>. 3. The origin of all changes, in consequence of two principles, viz. *discord* (πόλεμος, ἔρις), and *concord* (εἰρήνη, ὁμολογία), and their mutual opposition (ἐναντιότης), according to fixed laws of fate (εἰμαρμένη<sup>a</sup>). 4. The principle of force and energy he asserted to be the principle also of thought. The universe he maintained to be full of souls and *dæmons*, endowed with a portion of this all-pervading fire. He maintained the excellence of the soul to consist in its *aridity*, or freedom from aqueous particles—αὔη ψυχὴ ἀρίστη or σοφωτάτη<sup>b</sup>. The soul, he continued, by its consanguinity to the divine mind, is capable, *by abstraction*, of recognising the universal, and the *true*; whereas by the exercise of the organs of the senses, it perceives only what is variable and individual<sup>c</sup>. We may remark, that this

system, with which we are very imperfectly acquainted, and which furnished a great many hints to Plato, the Stoics, and Ænesidemus, contained many original and acute observations; which were applied also to moral and political questions.

### V. *Speculations of the Atomic School.*

DIOG. LAERT. lib. IX, § 30, sqq.; and BAYLE's Dict. art. *Leucippe*.

104. *Leucippus*, a contemporary, possibly also a disciple of Parmenides<sup>d</sup>, opposed the system of the Eleatæ; which he unjustly accused of contradicting itself, by advancing the exclusive and narrow doctrine of atoms (the corpuscular system<sup>e</sup>); a doctrine which, agreeably to experience, maintained the existence of *motion* and *plurality*<sup>f</sup>. He asserted also the existence of a matter filling space (τὸ πλήρες), and constituting the element of *reality*; by the division of which we arrive at something indivisible, τὸ ἄτομον; while at the same time he taught the existence of a *vacuum* (τὸ κενόν); opposed to *material* reality, yet possessing a certain reality of its own<sup>g</sup>; and endeavoured to account for the actual state of the world by the union (σύγκρισις or συμπλοκή), and the separation (διάκρισις), of material reality, within the limits of this void. Accordingly, the *elementary principles* of this system of materialism are the atoms, vacuum, and motion; and we recognise in it none but *corporeal* essences. The atoms, the ultimate elements of what is real, are invariable, indivisible, and imperceptible, owing to their tenuity; they occupy space, and possess forms infinitely diversified; those which are round possessing also the property of motion. It is by their combination or separation (he continues)

<sup>d</sup> Flourished about 500 B. C. His birth-place is unknown; probably *Miletus*.

<sup>g</sup> ARIST. Phys. IV, 3.

that all things have their origin, and are brought to their dissolution; their modifications (ἀλλοιώσεις) and properties being determined by the position and order (θέσις and τάξις) of these particles; and take place in consequence of a law of absolute necessity. The soul itself he defined to be nothing but a mass of round atoms; whence result heat, motion, and thought<sup>h</sup>.

105. *Democritus* of Abdera<sup>i</sup>. This ardent inquirer into Nature, ill-understood by his countrymen of Abdera, and to whom has been attributed by subsequent tradition a laughing vein, in opposition to the melancholy of Heraclitus, his contemporary, had been a great traveller for the purpose of amassing instruction, and composed several works; none of which have come down to us entire. He expanded the atomic theory of his master, Leucippus<sup>k</sup>; to support the truth of which he maintained the impossibility of division *ad infinitum*; and from the difficulty of

assigning a commencement of time, he argued the eternity of existing nature, of void space, and of motion<sup>1</sup>. He supposed the atoms, originally similar, to be endowed with certain properties such as impenetrability, and a density proportionate to their volume. He referred every active and passive affection to motion, caused by impact; limited by the principle he assumed, that only like can act on like<sup>m</sup>. He drew a distinction between primary motion and secondary; impulse and reaction (*καλμὸς* and *ἀντιτυπία*); from a combination of which he deduced rotatory motion (*δίνη*). Herein consists the law of necessity (*ἀνάγκη*), by which all things in nature are ruled<sup>n</sup>. From the endless multiplicity of atoms have resulted the worlds which we behold, with all the properties of immensity, resemblance, and dissimilitude, which belong to them. The soul consists (such is his doctrine), in globular atoms of *fire*<sup>o</sup>, which impart movement to the body. Maintaining throughout his atomic theory, Democritus introduced the hypothesis of images (*εἰδῶλα*); a species of emanation from external objects, which make an impression on our senses, and from the influence of which he deduced sensation (*αἴσθησις*), and thought (*νόησις*). He distinguished between a rude, imperfect, and therefore false perception, and a true one (*γνησίη*<sup>p</sup>). In the same manner, consistently with his theory, he accounted for the popular notions of the Deity; partly through our incapacity to understand fully the phenomena of which we are witnesses, and partly from the impressions communicated by certain beings (*εἰδῶλα*) of enormous stature, and resembling the human

figure, which inhabit the air<sup>q</sup>. To these he ascribed dreams and the causes of divination<sup>r</sup>. He carried his theory into practical philosophy also, laying down that happiness consisted in an *equability of temperament* (εὐθυμία); whence he deduced his moral principles and prudential maxims<sup>s</sup>. Democritus had many admirers<sup>t</sup>; among others, *Nessus*, or *Nessas*, of Chios, and the countryman of the latter (and according to some his pupil), *Metrodorus* (by whom were propagated certain sceptical notions<sup>u</sup>); *Diomenes* of Smyrna; *Nausiphanes*, of Teios, the master of Epicurus; *Diagoras* of Melos, the freedman and disciple of Democritus, who is also numbered among the Sophists (§ 109), and was obliged to quit Athens<sup>x</sup>, on account of his reputed atheism<sup>y</sup>; *Anaxarchus* of Abdera, the contemporary and friend of Alexander the Great; and others. It was from Democritus that Epicurus borrowed the principal features of his metaphysics.

Sketch of the Life, Character, and Philosophy of Anaxagoras, *Classical Journal*, No. XXXIII, p. 173-177.

106. *Anaxagoras*<sup>a</sup>, animated by an extraordinary love of science, distinguished himself among the most celebrated thinkers by following this principle, that the study of the heavens and of nature is the proper occupation of man<sup>a</sup>. He is looked upon by some as the disciple of Anaximenes (which is inconsistent with chronology), and by others, of Hermotimus, who was also a native of Clazomenæ, and is said to have recognised a Superior Intelligence as the Author of nature<sup>b</sup>. In his forty-fifth year Anaxagoras fixed himself at Athens; but in consequence of the machinations of a party, he was accused of being an enemy to religion, without it being possible for Pericles himself to protect him; and retired to end his days at Lampsacus<sup>c</sup>. Nothing has so much contributed to his celebrity as his doctrine of a Νοῦς, or intellectual principle, the Author of the universe; a conclusion to which he was led in consequence of the superior attention he paid to the system of nature: the mystical revelations of his countryman Hermotimus<sup>d</sup> possibly contributing to

form in him this opinion; as well as the manifest inconsistency and inadequacy of all those systems which had recognised only *material* causes. Adhering to the principle, *ex nihilo nihil fit*, he admitted the existence of a chaotic matter, the constituent elements of which, always united and identical (τὰ ὁμοιομερῆ)<sup>e</sup>, are incapable of being decomposed; and by the arrangement of which and their dissemination he undertook to account for the phenomena of the natural world<sup>f</sup>: adding, that this chaos, which he conceived surrounded by air and ether, must have been put in movement and animated at the first by the Intelligent Principle. Νοῦς he defined to be the ἀρχὴ τῆς κινήσεως. From this first principle he deduces motion, at first circular; the result of which rotation (he maintained), was the separation of the discordant particles; the union and amalgamation of those which were homogeneous; and in fine, the creation of symmetry and order. *Intelligence*, he considered the active and creative cause; he believed this principle to be endowed spontaneous energy: to be simple and pure; refined from all *matter*; pervading all things; defining and limiting all things; and consequently, the principle of life, sensation, and mental perception<sup>g</sup>.

Anaxagoras was more inclined to the study of physics than of metaphysics, for which he is blamed by Plato<sup>h</sup>

<sup>e</sup> The term Homœomeriæ appears to be of more recent invention.

Another of his maxims was, ἐν παντί πάντα, that in every thing there is a portion of every thing.

and by Aristotle<sup>b</sup>. Accordingly he explained on physical principles the formation of plants and animals, and even of the heavenly bodies<sup>i</sup>: which drew upon him the reproach of atheism<sup>k</sup>. He admitted to a certain extent the validity of the evidence of the senses; but reserved for reason (λόγος), the discrimination of *objective* truth<sup>l</sup>.

*Diogenes of Apollonia and Archelaus.*

107. *Diogenes* of Apollonia (in Crete), and *Archelaus* of Miletus (or, according to others, of Athens); both of whom were about this time resident at Athens, appear, in different ways, to have blended the doctrines of Anaxagoras with those of Anaximenes. Diogenes<sup>m</sup> maintained that air was the fundamental principle of all Nature, and imputed it to an intellectual energy<sup>n</sup>: uniting in this respect the system of Anaximenes with that of Anaxagoras. On the other hand, *Archelaus*, a disciple of Anaxagoras<sup>o</sup>, maintained that all things were disengaged from the original chaos by the operation of two discordant principles of

<sup>t</sup> GE. PHIL. OLEARII Progr. de Morte Empedoclis, *Lips.* 1733, fol.

He cannot have been an immediate scholar of the first, inasmuch as Aristotle (Met. I, 3) represents him as contemporary with, but younger than Anaxagoras; and because he appears to have been the master of Gorgias. His philosophy, which he described in a didactic poem, of which only fragments have come down to us, combined the elements of various systems: most nearly approaching that of Pythagoras and Heraclitus, but differing from the latter, principally: 1st. Inasmuch as Empedocles more expressly recognises *four* elements<sup>u</sup>, earth, water, air, and fire: these elements, (compare his system, in this respect, with that of Anaxagoras), he affirmed not to be *simple* in their nature; and assigned the most important place to fire<sup>x</sup>. 2dly. Besides the principle of concord (φιλία), opposed to that of discord (νεῖκος), (the one being the source of union and good, the other of their opposites), he admitted into his system *necessity* also, to explain existing phenomena<sup>y</sup>. To the first of these principles he attributed the original composition of the elements. The material world (σφαῖρος, μῦγμα<sup>z</sup>) he believed, as a whole, to be divine: but in the *sublunar* portion of it he detected a considerable admixture of evil and imperfection<sup>a</sup>. He taught that at some future day all things must again sink into chaos. He advanced a subtile and scarcely intelligible theory of the active and passive affections of things (Cf. Plato Menon. ed. Steph. p. 76, C. D. Arist. De Gener. et Corr. I, 8; Fragm. ap. Sturz. v. 117), and drew a distinction between the world as presented to our senses (κόσμος αἰσθητός), and that which he presumed to be the type of it, the intellectual world (κόσμος νοητός)<sup>b</sup>. He looked for the principle of life in fire: admitting at the same time, the existence of a Divine Being

pervading the universe<sup>c</sup>. From this superior intelligence he believed the *Dæmones* to emanate, to whose nature the human soul is allied. The soul he defined to consist in a combination of the four elements (to account for the knowledge it possesses, of external objects, which he conceived was owing to an *analogy* subsisting between the subject and the object); and its seat he pronounced to be principally the blood<sup>d</sup>. He appears to have made a distinction also between good and evil *dæmones*<sup>e</sup>.

<sup>f</sup> The term *σοφιστής* had at first been equivalent to that of *σοφός*.

persons possessed of a merely superficial and *seeming* knowledge; to the profession of which they were influenced by merely interested motives. The Sophists *Gorgias*, *Protagoras*, *Prodicus*, *Hippias* of Elis, *Polus*, *Thrasymachus*, and *Callicles*, were orators and scholars very well practised it is true in the art of speaking, of dialectics, criticism, rhetoric, and politics, but being totally devoid of any real love of philosophy, were anxious only so far to follow the current of their time which set that way, as to promote their own advantage by means of their ability as disputants. All they desired was to distinguish themselves by the show of pretended universal knowledge; by solving the most intricate, most fanciful, and most useless questions: and above all, hoped to get money by the pretended possession of the art of persuasion<sup>a</sup>. With this view they had contrived certain logical tricks of a kind to perplex their antagonists; and, without possessing in the least degree a spirit of philosophy, they maintained all sorts of philosophical theories. The end of their system would have been to destroy all difference between truth and error.

Their conduct reflected much of the general character of their age and country, while it had the advantageous effect of awakening at length, in others, a nobler and more elevated spirit of inquiry.

110. The celebrated orator, *Gorgias* of Leontium<sup>b</sup>, a disciple of Empedocles, endeavoured, in his work on Nature<sup>i</sup>, to demonstrate by certain subtile arguments, which it is not necessary to repeat here, *that nothing real exists*; nothing which can be known; or communicated by the means of words<sup>k</sup>. The distinction he established between

<sup>6</sup> SEXT. Hyp. Pyrrh. III, 218; Adv. Math. IX, 54.

<sup>7</sup> ARIST. De Animâ, I, 2.

CRITIÆ Tyranni Carminum aliorumque ingenii Monumentorum, quæ supersunt, dispos. illustr. et emend. NIC. BACHIVS. Præmissa est Critiæ Vitâ a Philostrato descripta, Lips. 1827, 8vo. GUIL. ERN. WEBER de Critia Tyranno Progr. Francf. ad M. 1824, 4to.

to be able to discover some solid foundation on which philosophy might take its ground, and defend the principles of truth, religion, and morality. With this period began a better system of Greek philosophy, established by the solid good sense of Socrates. Philosophy was diverted into a new channel, and proceeded from the *subject* to the *object*, from *man* to *external nature*, instead of beginning at the other end of the chain. It became the habit to investigate no longer merely speculative opinions; but likewise, and in a still greater degree, *practical* ones also. Systematic *methods* of proof were now pursued, and the conclusions arrived at diligently compared. The want which all began to feel of positive and established principles, gave birth to different systems; at the same time that the scrupulosity with which all such systems were examined, kept alive the spirit of original inquiry.

112. This alteration was effected under the influence of some *external* changes of circumstances also. Athens had now become, by her constitution and her commerce, by the character of her inhabitants, the renown she had acquired in the Persian war, and other political events, the focus of Grecian arts and sciences. In consequence, she was the scene of the labours of their philosophers: schools were formed in which ideas might be communicated, the intellectual powers of those who frequented them developed by more frequent and more various contact of the opinions of others, and emulation continually excited towards continually higher objects. On the other hand these schools were liable to the defect of fostering by their very facilities of acquiring knowledge, a certain intellectual indolence; increased by the easy repetition of the doctrines of their teachers, and aided by the *methodical* nature of the instruction itself. It was to the powerful influence of the character and inquiries of Socrates, that the philosophy of the period owed the new impressions and bias which were given to it.

I. *Socrates.*

The principal authorities are<sup>a</sup>: Xenophon (particularly the *Memorabilia* and *Apology* of Socrates), and Plato (*Apology*?) (Compare these two writers, in this respect). Secondary sources: Aristotle, Cicero, Plutarch, Sextus Empiricus, Diogenes Laertius (II, 18, sqq.), Apuleius.

113. *Socrates* was born at Athens in 470 or 469, and was the son of a poor sculptor named Sophroniscus, and of Phænareta a midwife. He formed himself to a character completely opposed to the frivolity and sophistical habits of the refined and corrupted age to which he belonged, living all the while in constant habits of society, even with certain characters less distinguished for their

<sup>a</sup> The pretended *Epistles* of Socrates, lately published (cf. the bibliography at the head of § 88), are spurious. See CHPH. MEINERS, *Judicium de quorundam Socraticorum reliquiis* in *Comment. Soc. Gött.* vol. V, p. 45, sqq.

virtues than their accomplishments. He took for his model the abstract idea of a true philosopher, who throughout his life, as a man, and as a citizen, should exhibit an instance of the perfectibility of human nature. He became the instructor of his countrymen and of mankind, not for the love of lucre nor of reputation, but in consequence of a sense of duty. He was desirous above all things to repress the flight of speculative theories by the force of an imperturbable good sense; to submit the pretensions of science to the control of a higher authority, that of virtue; and to re-unite religion to morality. Without becoming, properly speaking, the founder of a school or system of philosophy, he drew around him, by the charms of his conversation, a crowd of young men and others, inspiring them with more elevated thoughts and sentiments, and forming several of those most devoted to him into very brilliant characters. He encountered the Sophists with the arms of good sense, irony, and the powerful argument of his personal character. A constant enemy to mysticism and philosophical charlatanism (even in the circumstances of private life), he drew upon himself the hatred of many; under which he ultimately fell<sup>b</sup>, being put to death by hemlock in the year 400 B. C.<sup>c</sup>, Ol. XCV, 1.

114. Although, properly speaking, Socrates was not

115. The exclusive object of the philosophy of Socrates was the attainment of correct ideas concerning moral and religious obligation; concerning the end of man's being, and the perfection of his nature; and lastly his duties; all of which he discussed in an unpretending and *popular* manner; appealing to the testimony of the moral sense within us. 1st. The chief happiness of man consists in knowing the good which it his duty to do, and acting accordingly: this is the highest exercise of his faculties, and in this consists *εὐπραξία* (right-action)<sup>d</sup>. The means to this end are self-knowledge, and the habit of self-control. Wisdom (*σοφία*), which he often represents as moderation (*σωφροσύνη*), may be said, to embrace all the virtues<sup>e</sup>; and on this account he sometimes called virtue a *science*<sup>f</sup>. The duties of man towards himself embrace also *ἐγκράτεια* (continence), and courage, (*ἀνδρεία*)<sup>g</sup>. Our duties towards others are comprised in justice (*δικαιοσύνη*); the fulfilment, that is, of the laws, human and divine. Socrates appears to have been the

himself with his characteristic *εἰρωνεία*, or affected ignorance, and with his peculiar logic<sup>†</sup>.

117. The services which Socrates has rendered to philosophy are twofold; negative and positive. *Negative*, inasmuch as he avoided all vain discussions; combated mere speculative reasoning on substantial grounds; and had the wisdom to acknowledge ignorance when necessary; but without attempting to determine accurately what is capable, and what is not, of being accurately known. *Positive*, inasmuch as he examined with great ability the ground directly submitted to our understanding, and of which Man is the centre; without, however, any profound investigation of the different ideas and motives which influence practice. He first distinguished that Free-will and Nature were both under the dominion of certain laws; pointed out the proper sources of all knowledge; and finally laid open new subjects for philosophic research.

On the pretended letters of the Socratic philosophers, see the remark above, § 113.

*Simo*<sup>1</sup>, *Crito*, and the Theban *Cebes*<sup>2</sup>, disseminated the principles of their master and lived agreeably to them. Among those who especially devoted themselves to the pursuits of philosophy, *Antisthenes* the Athenian, founder of the Cynic school, subsequently *Aristippus*, the chief of the Cyrenaic, and afterwards *Pyrrho*, gave their attention exclusively to questions of morals, and their practical application. *Euclid* of Megara, *Phædo* of Elis, *Menedemus* of Eretria, were occupied with theoretical or metaphysical inquiries. The more exalted genius of Plato embraced at once both these topics, and united the two principal branches of Socraticism; either of which separately was found sufficient to employ the generality of the Socratic philosophers. When we examine the spirit of these different schools, the Cynics, the Cyrenaics, the Pyrrhonists, and the Megareans; (as for the schools of Elis and Eretria we are but imperfectly acquainted with them); and lastly, that of the Platonists; we find that the four first did little more than expand the ideas of Socrates, with partial views of his system; while the latter is distinguished by a boundless activity, allied to the true Socratic spirit; and which explored all the subjects of philosophic investigation.

### *Antisthenes.*

GOTTLOB LUD. RICHTER, Diss. de Vitâ, moribus ac placitis Antisthenis Cynici, *Jen.* 1724, 4to.

LUD. CHR. CRELLII Progr. de Antisthene Cynico, *Lips.* 1728, 8vo.

119. *Antisthenes*, an Athenian<sup>a</sup>, at first the disciple of Gorgias, afterwards the friend and admirer of Socrates; was virtuous even to excess, and proportionably arrogant. He placed the supreme good of man in virtue; which he defined to consist in abstinence and privations, as the means of assuring to us our independence of external objects: by such a course he maintained that man can reach the highest perfection, the most absolute felicity, and become like to the Deity. Nothing is so beautiful as virtue; nothing as deformed as vice; (τ'αγαθὰ καλὰ, τὰ κακὰ αἰσχροῦ); all things else are indifferent (ἀδιάφορα), and consequently unworthy of our efforts to attain them<sup>b</sup>. On these principles he built a system of practice so excessively simple, as to exclude even the decencies of social life; and for the same reasons professed a contempt for speculative science<sup>c</sup>, alleging that the natures of things are undefinable. He maintained also that opinions are all identical, and that no man can refute those of another<sup>d</sup>. We must not omit his idea of one Divinity, superior to those adored by the populace<sup>e</sup>.

120. In spite of the unattractive austerity of his way of

<sup>a</sup> Flourished about 380 B. C.

<sup>b</sup> DIOG. LAERT. VI, 11, sqq., 103, 106.

<sup>c</sup> Notwithstanding, many works of his are quoted (DIOG. LAERT. VI, 15, sqq.) of which only two speeches remain to us, printed among the Orat. Græc. of REISKE, tom. VIII, p. 52, sqq.

<sup>d</sup> ARIST. Metaph. VIII, 3, V, 29. PLAT. Sophist., p. 270.

<sup>e</sup> CIC. De Nat. Deor. I, 13.

life, which procured him the surname of Ἀπλοκύν, Antisthenes, by his lofty spirit and the eccentricity of his character and conduct, drew about him a great number of partisans, who were called *Cynics*; whether from the *Cynosarges*, where their master taught, or from the rudeness of their manners<sup>f</sup>. Among these we remark *Diogenes* of Sinope<sup>g</sup>, said, on doubtful authority, to have lived in a tub; who gave himself the name of Κύν<sup>h</sup>, and practised a species of asceticism<sup>i</sup>: and after him, his disciple *Crates* of Thebes<sup>k</sup>, and his wife, *Hipparchia* of Maronea; but these latter are not distinguished for having contributed any thing to the cause of science. *Onesicritus* of Ægina, *Metrocles* the brother of Hipparchia, *Monimus* of Syracuse, *Menedemus*, and *Menippus*, are cited, but less frequently. The Cynic school finally merged in that of the Stoics: it made an ineffectual attempt to rise again in the centuries immediately succeeding the birth of our Lord; but without displaying the spirit, merely by affecting the exterior of the ancient Cynics<sup>l</sup>.

## II. Cyrenaics.

Authorities: Xenophon, Aristotle, Cicero, Plutarch, Sextus Empiricus, adv. Math. VII, 11, Diog. Laert. II.

121. Aristippus<sup>m</sup> of Cyrene, a colonial city of Africa; born to easy circumstances, and of a light and sportive character, had, when he first attended the conversations of Socrates, an inclination for self-indulgence, which the latter eventually succeeded in rendering more elevated, without being able to eradicate<sup>n</sup>. He made the *summum bonum* and the τέλος of man to consist in enjoyment, accompanied with good taste, and freedom of mind, τὸ κρατεῖν καὶ μὴ ἡττᾶσθαι ἡδονῶν ἄριστον, οὐ τὸ μὴ χρῆσθαι<sup>o</sup>. Other pursuits and sciences he made very light of, especially the Mathematics<sup>p</sup>. His grandson *Aristippus*, surnamed *Metrodidactus* (because instructed by his mother Arete, daughter of the elder Aristippus<sup>q</sup>), was the first to develop, on these principles, a complete system of the philosophy of self-indulgence, ἡδονισμός. This sort of philosophy takes for its basis the affections, principally of the body (πάθη); which it divides into pleasurable and the reverse; giving the preference to the pleasures of the senses. Its degraded object is not εὐδαιμονία, but merely present and actual enjoyment (ἡδονὴ ἐν κινήσει); allowing something to wisdom and virtue (as they were pleased to term them), as means of attaining thereto<sup>r</sup>. The philo-

sophy of these teachers (neglecting logic and the natural sciences), was confined to what they called a system of morals; built entirely on that of the sensations, as being the only objects of knowledge concerning which we are not liable to err (*καταληπτέα καὶ ἀδιάψευστα*<sup>a</sup>), and at the same time the only *criteria* of virtue<sup>b</sup>.

122. This species of philosophy, when it came to be compared with our notions of Truth, Justice, and Religion, gave birth to a subdivision of the sect of Cyrenaics, called also *Hdonics* (*ἡδονικοί*). *Theodorus* (of Cyrene?), surnamed the *Atheist*, a disciple of the second Aristippus<sup>u</sup>, and probably also of the Stoic Zeno, the Sceptic Pyrrho, and others<sup>x</sup>, taking, like his predecessors, Sensation for the basis of his argument, ended by denying the existence of all objects of perception; disallowed the reality of an universal *criterium* of Truth, and thus opened the way for the Sceptic school: framing to himself a system (*Indifferentism*), which excluded all differences of right and wrong, in Morals and in Religion, and assuming pleasure or gaiety (*χαρά*), as the final end of existence. His followers denominated themselves *Θεοδῶρειοι*<sup>y</sup>. His disciple, Bio of Borysthenis<sup>z</sup>, and *Euhemerus* (according to some of Messene<sup>a</sup>), made an application of

this doctrine to the religion then prevalent<sup>b</sup>. *Hegesias*, who in the time of Ptolemy taught at Alexandria, a native of Cyrene and pupil of the Cyrenaic *Paræbates*, was equally decided in maintaining the *indifference* of right and wrong, but asserted that perfect pleasure is unattainable in our present state (*ἀδύνατον καὶ ἀνυπαρκτόν*), and concluded that death was therefore preferable to life. Hence he was surnamed *Πεισθάνατος*<sup>c</sup>. He became the founder of a sect, the Hegesians.

123. *Anniceris* of Cyrene, who appears, like Hegesias, to have been a disciple of Paræbates, and to have taught at Alexandria, endeavoured, without renouncing the principles of his sect, to get rid of their revolting consequences, and to reconcile them with our sentiments in favour of friendship and patriotism, by pleading the refined pleasures of benevolence<sup>d</sup>: thus making the Cyrenaic system approximate that of Epicurus. The success of the latter caused the downfall of the Cyrenaic school.

124. *Pyrrho* of Elis<sup>e</sup>, originally a painter, together with his master Anaxarchus accompanied Alexander in his campaigns, and subsequently became a priest at Elis. In common with Socrates (whom in some particulars he resembled), he maintained that virtue alone is desirable<sup>f</sup>; that every thing else, even science, is useless and unprofitable. To support this last proposition, he alleged that the contradiction existing between the different principles supported by disputants (ἀντιλογία, ἀντίθεσις τῶν λόγων), demonstrates the *incomprehensibility* of things (ἀκαταληψία). All this, he argued, should make a philosopher withhold his assent (ἐπέχειν), and endeavour to maintain an ἀπαθεία, or freedom from all impressions. By this doctrine, Pyrrho and his school attached a special meaning on the word σκέψις (examination), which had already been frequently employed more loosely<sup>g</sup>. His friend and pupil *Timon*, a physician of Phlius, and previously a

Hence the Pyrrhonists are also called *Sceptics*, in the proper sense of the word: they have been more properly denominated *Ephectics* (from ἐποχή, suspension of judgment), *Zetetics*, and *Aporetics* (investigators, and doubters).

pupil of Stilpo at Megara<sup>b</sup>, carried still farther this system of scepticism, which had begun on moral principles<sup>i</sup>, and maintained with sarcastic bitterness the following propositions<sup>k</sup> against the Dogmatics\*: the doctrines of the Dogmatics are founded not on substantial principles, but mere hypotheses:—the objects of their speculations do not come within the compass of certain knowledge:—all science is to be accounted vain, as not contributing to happiness:—in questions of practice we ought to give ear only to the voice of our own nature, that is of our sensations; and by withholding the assent in matters of speculation (*ἀφασία*), should endeavour to retain the mind in a state of unalterable repose (*ἀταραξία*)<sup>l</sup>. A question has been raised whether the *Ten sources of doubt* (*δέκα ἢ ἑκατόν τρόποι τῆς ἐποχῆς*), of the Sceptics<sup>m</sup>, are the work of Pyrrho or Timon. The latter left behind him no disciple of note.

<sup>m</sup> See, subsequently, under the art. *Ænesidemus*.

125. *Euclid* of Megara<sup>n</sup>, had studied the philosophy of the Eleatæ previously to his becoming a disciple of Socrates. After the death of his master; having, together with the most of his other pupils taken refuge at Megara, he established there a school; the principal object of which was the cultivation of Dialectics, on the principles of Socrates and the Eleatæ. The subtilties of this sect, which were sufficiently censured of old (witness the appellation of ἐριστικοί), have been still more severely condemned by the moderns; who it must be allowed, have not been able to collect a sufficiently accurate account of what their practice really was. They appear to have pointed out the difficulties which attend rationalism and empiricism: and to have pursued certain Dogmatics to their last defences, particularly Aristotle and Zeno. Practical philosophy appears, with the exception of Stilpo, to have engaged the attention of few of this school.

126. *Euclid* gave as it were a new edition of the Eleatic doctrine: Good is one (ἐν τὸ ἀγαθόν); which alone is real and invariable: reasoning by analogy he rejected (διὰ παραβολῆς λόγους); attacking not so much the premises assumed, as the conclusions drawn (ἐπιφοράν)<sup>o</sup>. *Eubulides* of Miletus, and his disciple *Alexinus* of Elis (nicknamed Ἐλέγξινος), are only known as the authors of certain captious questions (ἄλυστα); which they levelled at the Empirics, and in particular at Aristotle; such as; the σωρείτης, the ψευδόμενος, the κερατινῆς, etc.<sup>p</sup>. *Diodorus* surnamed *Cronus*, of Jasus in Caria, the pupil, according to some, of Eubulides, denied the twofold significations of words<sup>q</sup>, investigated the question of possibilities (περὶ δυνατῶν)<sup>r</sup>, and specu-

lated concerning the truth of hypothetical judgments (τὰ συνημμένον)<sup>3</sup>; and finally advanced some arguments to disprove the reality of *motion*<sup>4</sup>. His disciple *Philo*, the Dialectic (who must not be confounded with the Stoic, or with the Academician of the same name), became his opponent on these subjects. *Stilpo* of Megara, a philosopher venerable for his character<sup>5</sup>, *disallowed the objective validity of relative ideas* (τὰ εἶδη); *and the truth of opinions not identical*<sup>6</sup>. He made the character of a wise man to consist in *apathy* or impassibility (*animus impatiens*, Senec. Ep. 9.): from which doctrine his disciple *Zeno* deduced a great number of consequences. We find also mentioned as *Megarics*, *Bryso* or *Dryso*, a son of *Stilpo*; *Clinomachus*<sup>7</sup> and *Euphantus*.

#### V. Schools of Elis and Eretria.

127. The schools founded by *Phædo* of Elis and *Menedemus* of Eretria (§ 118), are not, as far as we can learn, more distinguishable from each other than from that of Megara. The first was a true disciple of Socrates<sup>8</sup>: his opinions were set forth in dialogues which have not come down to us. The second, a hearer of Plato and *Stilpo*, may be said to have continued at Eretria the school of

Elis<sup>a</sup>. He and his disciples (in this respect resembling Stilpo), limited truth to *identical propositions*<sup>b</sup>. They denied that it could be inferred by negative categorical propositions, or conditional and collective.

### III. *More complete Systems, proceeding from the School of Socrates.*

128. A more complete system of dogmatic philosophy was founded at the Academia by Plato ; on the principles of the Rationalists : and another by his disciple Aristotle, on those of the Empirics<sup>c</sup>. From the Cynic school sprang the Stoics, and from the Cyrenaics the Epicureans. The dogmatism of the Stoics called forth the opposition of the Academician *Arcesilaus*, with whom began the scepticism of the later Academy. In this manner, from the Socratic school arose four dogmatical systems ; diverging from one another in theory and practice ; and, in addition to these, a school decidedly sceptical.

Translations by COUSIN (French), SYDENHAM, and SCHLEIERMACHER.

129. *Plato*<sup>d</sup> was born at Athens 430 or 429 B. C., in the 3rd or 4th year of the LXXXVII. Ol., the son of Aristo and Perictione, of the family of Codrus and Solon, and was endowed with distinguished talents for poetry and philosophy. By the advice of Socrates he attached himself to the latter pursuit. He had originally some inclination for public life, but was disgusted by the perpetual changes which took place in his time in the governments of Greece; by the corruptions of the democracy, and the depravity of the manners of his countrymen\*. His studies were happily promoted by a diligent cultiva-

<sup>d</sup> His proper name was Aristocles.

\* PLAT. Epist. VII.

tion of poetry and the mathematics; by foreign travel, particularly in Italy and Sicily; and by familiar intercourse with the most enlightened men of his time; particularly with Socrates, whose conversations he attended for eight years \*<sup>f</sup>; as well as by the correspondences which he entertained with the Pythagoreans of Magna Græcia<sup>g</sup>. In this manner was formed this great philosopher, surpassing, perhaps, all, by the vastness and profoundness of his views, and the correctness and eloquence with which he expressed them: while his moral character entitled him to take his place by the side of Socrates. He founded in the *Academia* a school of philosophy, which for a long period was a nursery of virtuous men and profound thinkers. Plato died in the first year of the CVIII. Olympiad, 348 B. C.

130. His works, principally in the form of dialogues<sup>h</sup>; (models of excellence for the rare union of a poetic and philosophic spirit)<sup>i</sup>; are the only incontestible authorities respecting his opinions; but we must not hope to attain his entire system except by conjecture, as he had certain doctrines (*ἀγραφα δόγματα*) which he did not communicate

\* He had previously become acquainted with the system of Heraclitus.

except to those whom he entrusted with his *esoteric* philosophy<sup>k</sup> \*.

131. Plato, by his philosophical education and the superiority of his natural talents, was placed on an eminence which gave him a commanding view of the systems of his contemporaries, without allowing him to be involved in their prejudices<sup>l</sup>. He always considered theoretical and practical philosophy as forming essential parts of the same Whole: and conceived that it was only by means of true philosophy that human nature could attain its proper perfection<sup>m</sup>.

132. His critical acquaintance with preceding systems, and his own advantages, enabled Plato to form more adequate notions of the proper end, extent, and character of philosophy<sup>n</sup>. Under this term he comprehended a knowledge of the Universal, the Necessary, the Absolute; as well as of the relations and essential properties of objects<sup>o</sup>: Philosophy he defined to be Science, properly so called. The source of knowledge he pronounced to be not<sup>p</sup> the evidence of our senses, which

are occupied with *contingent* matter, nor yet the *understanding*,\* but Reason<sup>q</sup>, whose object is that which is Invariable, and Absolute (τὸ ὄντως ὄν<sup>r</sup>). He held the doctrine of the existence in the soul of certain *innate ideas* (νοήματα) which form the basis of our conceptions, and the elements of our practical resolutions. To these ἰδεαι, as he termed them (the eternal παραδείγματα, types or models of all things, and the ἀρχαί, or principles, of our knowledge), we refer the infinite variety of individual objects presented to us (τὸ ἄπειρον, and τὰ πολλά<sup>s</sup>). Hence it follows that all these details of knowledge are not the results of experience, but only developed by it. The soul *recollects* the Ideas in proportion as it becomes acquainted with their copies (ὁμοιώματα), with which the world is filled: the process being that of recalling to mind the circumstances of a state of pre-existence<sup>t</sup>. Inasmuch as the objects thus presented to the mind correspond in part with its *Ideas*, they must

have some principle in common; that principle is the Divinity, who has formed these external objects after the model of the Ideas<sup>a</sup>. Such are the fundamental doctrines of the philosophy of Plato; in accordance with which he placed the principles of identity and contradiction among the highest laws of philosophy<sup>x</sup>; and drew a distinction between *Empirical* knowledge and *Rational*; the one being derived from the Intellectual, the other from the External world, (κόσμος αἰσθητός and νοητός): making the latter the only true object of philosophy.

The system of Plato is an instance of *Rationalism*.

133. The division of philosophy into Logic (Dialectics), Metaphysics (Physiology or Physics), and Morals (the Political science), has been principally brought about by Plato<sup>y</sup>, who clearly laid down the chief attributes of each of these sciences, and their mutual dependencies, and distinguished also between the analytical and synthetical methods. Philosophy therefore is under great obligations to him, *quoad formam*. She is no less indebted to him for the lights he has thrown upon the above parts considered separately; though he did not profess to deliver a system of each, but continually excited the attention of others, in order to further discoveries.

134. Plato considered the soul to be a self-acting energy (αὐτὸ ἐαυτὸ κινεῖν)<sup>z</sup>: and viewed as combined with the body, he distinguished in it two parts, the rational (λογιστικὸν, νοῦς); and the irrational or animal (ἄλογιστικὸν or ἐπιθυμητικὸν): mutually connected by a sort of middle term (θυμὸς, or τὸ θυμοειδές<sup>a</sup>.) The animal part has its origin in the imprisonment of the soul in the body<sup>b</sup>; the intellectual still retains a consciousness of the *Ideas*:

whereby it is capable of returning to the happy condition of Spirits. In Plato we discover also a more complete discrimination of the faculties of knowledge, sensation, and volition<sup>c</sup>; with admirable remarks on their operations, and on the different species of perception, of sensation, of motives determining the will; as well as the relations between Thought and Speech. (See for the last, *Theætet.* ed. Steph. p. 189, E sqq. *Phileb.* p. 38, D.)

135. Plato has rendered no less service to philosophy by affording it the first sketch of the laws of thought, the rules of propositions, of conclusions, and proofs, and of the analytic method: the distinction drawn between the Universal (κοινόν), and Substance (οὐσία); and the Particular and the Accidental: he diligently investigated the characteristics of Truth, and detected the signs of the *phenomenon*, or *apparent* Truth<sup>d</sup>: to him we owe the first attempt at the construction of a philosophical Language<sup>e</sup>: the first development of an abstract idea of knowledge and science<sup>f</sup>: the first logical statement of the properties of Matter, Form, Substance, Accident, Cause and Effect, of Natural and Independent Causes of Reality (τὸ ὄν), and of Apparent Reality (φαινόμενον); a more adequate idea of the Divinity, as a being eminently good; with a more accurate induction of the Divine Attributes<sup>g</sup>; especially the moral ones; accompanied by remarks on

<sup>g</sup> De Rep. II, p. 250; VII, 133.

the popular religion, and an essay towards a demonstration of the existence of God by reasonings drawn from Cosmology<sup>c</sup>. He represented the Divinity as the author of the world, inasmuch as he introduced into rude matter (*ἐλη—τὸ ἄμορφον*), order and harmony, by moulding it after the *Ideas*, and conferring (together with a rotatory motion), an harmonious body, governed as in the case of individual animals, by a rational spirit. He also described the Divinity (in respect of his providence), as the author and executor, or guardian of the laws of Morals; and to him we owe the first speculative essay on Divine Justice; according to his views, the existence of evil not being attributable to the Deity, inasmuch as it results from matter, and he having ordered all things in such a way as to exclude as much as possible its existence<sup>h</sup>: lastly, to him we owe the first formal development of the doc-

trine of the spirituality of the soul, and the first attempt towards demonstrating its immortality<sup>1</sup>.

136. The interesting research which Plato carried so far, respecting the Supreme good<sup>k</sup>, belongs to the subject of *Morals*. Virtue he defined to be the imitation of God, or the effort of man to attain to a resemblance to his original (*ὁμολῶσις θεῷ κατὰ τὸ δυνατόν*<sup>l</sup>); or in other terms a unison and harmony of all our principles and actions according to reason<sup>m</sup>, whence results the highest degree of happiness. Virtue is *one*, but compounded of four

elements: Wisdom (σοφία—φρόνησις); Courage, or Constancy (ἀνδρεία); Temperance (σωφροσύνη); and Justice (δικαιοσύνη<sup>a</sup>): which are otherwise termed the four cardinal virtues. Such virtues he describes as arising out of an Independence of, and Superiority to, the influence of the senses. In his practical philosophy Plato blended a rigid principle of moral obligation with a spirit of gentleness and humanity; and education he described as a liberal cultivation and moral discipline of the mind<sup>o</sup>. Politics he defined to be the application, on a great scale, of the laws of Morality; (a society being composed of individuals and therefore under similar obligations); and its end to be liberty and concord. In giving a sketch of his Republic, as governed according to reason, Plato had particularly an eye to the character and the political difficulties of the Greeks<sup>p</sup>; connecting at the same time, the discussion of this subject with his metaphysical opinions respecting the soul<sup>q</sup>. Beauty he considered to be the sensible representation of moral and physical perfection<sup>r</sup>: consequently it is one with Truth and Goodness, and

inspires love (*ἔρως*); which leads to virtue<sup>1</sup>. (Platonic Love.)

137. Plato borrowed considerably from other philosophers, particularly the Pythagoreans; who suggested to him the leading idea that all the variety of existing objects are compounded of a substance and a superinduced form: but what he borrowed his own genius stamped with a character of originality, and blended the discordant systems of older philosophy in an harmonious whole; the striking advantages of which are the Unity it presents in its system of *Ideas*; the combination in one and the same interest of all our motives of action, speculative or practical; the strictness of the union which he maintains between Virtue, Truth, and Beauty: the infinite variety of new ideas of which the germes are to be found in his system; and finally, for the love of science which his meditations inspire. On the other hand his system is not without its weak side: he did not sufficiently distinguish between ideas originating in the mind itself and those which are acquired by experience; and his account of the origin of the *Ideas*, borders on Mysticism. There are faults also in his *manner*: the union of much imagination with reasoning, of a poetic with a philosophic spirit, and the total absence of any *systematic* form, have rendered his doctrine difficult to be apprehended; gave occasion for abundance of misinterpretations; and ultimately had great influence over the fortunes of Platonism.

138. Plato drew around him a crowd of disciples and admirers; many of them celebrated statesmen, and even several females<sup>2</sup>; among others *Axiothea* of Phlius, and *Lasthenia* of Mantinea. As the doctrines he had blended came subsequently to be redivided; and as succeeding ages produced a succession of different prevailing spirits of philosophy, his school was subdivided into several

<sup>2</sup> *Diog. Laert.* III, 46.

sects; and thus gave birth to various *Academies*. To the *first* of these belonged *Speusippus* of Athens (died 339 B. C.), the nephew and successor of Plato<sup>u</sup>; and *his* successor *Xenocrates* of Chalcedon (died 314 B. C.)<sup>x</sup>; who in his manner of expressing himself resembled Pythagoras: for instance, in defining the soul to be *a self-moving number*. After him *Polemo* of Athens<sup>y</sup> presided at the Academy; who considered the *summum bonum* to consist in a life regulated according to nature<sup>z</sup>; and subsequently *Crates* of Athens<sup>a</sup>. Finally *Crantor* of Soli, the friend and disciple of Xenocrates and Polemo, maintained the original system of the founder of the school, with the exception of a small number of alterations, applied principally to the popular doctrines of practical morality<sup>b</sup>. The *new Academy* (see below § 166, sqq.) directed its speculations to prove the uncertainty of human judgment: while the Neo-Platonists founded a school of enthusiasts who laid claim to a high degree of *illumination*.

139. Aristotle was born at Stagira, 384 B. C. XCIX. He inherited from his father Nicomachus, who had been the physician and friend of Amyntas king of Macedon, a predilection for natural philosophy. From 368 B. C. he continued, for twenty years, the disciple of Plato, improving under that great master his admirable talents for analysis; though, subsequently, he separated from him. In 343 he became the preceptor of Alexander, who assisted his scientific pursuits by sending to him collections of objects of natural history, and furnishing him with sums of money for the purchase of books<sup>c</sup>. He founded in 334 a new school in the *walks* of the Lycæum; whence the name of *Peripatetics*<sup>d</sup>; and died in 322<sup>e</sup> at Chalcis in Eubœa; probably by poison which he had taken, on being obliged to leave Athens, under the suspicion of atheism. Aristotle has bequeathed to us excellent works on all the sciences known to the Greeks, and particularly on Moral philosophy. These treatises are to be divided into exoteric and esoteric, or acroamatic<sup>f</sup>. The peculiar fortunes to which his works have been exposed<sup>g</sup>, have rendered still more difficult the examination and exposition of his doctrines, already sufficiently obscure, by their brevity and the peculiarity of the language he employed<sup>h</sup>.

140. Aristotle possessed in a high degree the talents of discrimination and analysis, added to the most astonishing knowledge of books, and the works of nature. To the latter, more especially, he had devoted himself. He rejected the doctrine of ideas<sup>i</sup>; maintaining that all our impressions and thoughts, and even the highest efforts of the understanding, are the fruit of experience<sup>k</sup>; that the world is eternal, even in its *form*, and not the work of a creative providence. In the theory of composition he drew a distinction between the *matter*, which he referred to philosophy, and the *form*, which he derived from poetry. Instead of following his master in his way of reasoning from the universal to the particular, he always takes the opposite course, and infers the first from the latter. His writings contain valuable remarks on the systems of his predecessors; his *own* being that of Empiricism, modified, in a slight degree, by the Rationalism of Plato<sup>l</sup>.

141. Philosophy, according to Aristotle, is science arising out of the love of knowledge; or knowledge according to certain principles<sup>m</sup>. There are two sorts of knowledge, mediate and immediate<sup>n</sup>. In order to make the first possible, the existence of the second is necessary. We become sensible *immediately* and by experience of *particulars* (τὰ καθ' ἑκαστα): *mediately*, but still by experience, we acquire the *universal* (τὰ καθ' ὅλου), and we thus

attain to that which is *real* and *necessary*, and is capable of being expressed in definitions and axioms. From *immediate* knowledge we deduce *mediate*, by means of arguments, the theory of which belongs to logic; the object of which is to show how we can ascertain by reasoning the certainty or the probability of things. Logic therefore is the instrument (*organum*) of all science or philosophy, but only *quoad formam*; (a distinction which was afterwards very often forgotten); for it is experience which must supply the matter to be worked upon, and wrought into general principles°. The first principle is that of contradiction; but, though productive of truth, it is the *test* and not the *constituent element* of truth<sup>p</sup>. By his works comprehended under the title of *Organum*, Aristotle has, next to Plato, rendered the greatest service to logic<sup>q</sup>; as the science which would establish the *formal* part of reasoning, and elucidate its theory: he there considers propositions and ideas as the elements of reasoning<sup>r</sup>, with admirable remarks on language interspersed; and he ought not to be made responsible for the abuse, which afterwards prevailed, of this art, when it came to be considered as capable of supplying not only the *form* but the *matter* of argumentation.

142. Aristotle, above every other philosopher, enlarged the limits of philosophy. He comprised therein all the sciences (rational, empirical, or mixed), with the single exception of history: and appears to have divided it as a whole into Logic, Physics, and Ethics; or into speculative

<sup>r</sup> Sophist. Elench. 34, fin.

and practical<sup>3</sup>. *Speculative* philosophy contemplates the *real* order of things; which is not dependent on our will: *practical*, the accidental and voluntary; real substances are either invariable (ἀκίνητα), or variable (κίνητα). The latter either perishable (φθαρτά), or imperishable. Sublunary things are variable and perishable: the heavens are imperishable, but variable: the Deity alone is imperishable and invariable. Consequently, speculative philosophy becomes, in proportion as it advances in abstraction, either Physics, or Mathematics, or what came to be afterwards called Metaphysics: relatively to *its objects*, it is divided into Physics, Cosmology, Psychology, and Theology. Practical philosophy comprehends Ethics, Politics, and Economy<sup>4</sup>. These subdivisions are not broadly traced, on defined principles, yet it is to Aristotle that we are indebted for the first hint of an encyclopædic system of the sciences; for having subjected to a rigorous examination the notions and principles of his predecessors; for having himself laboured to establish others by induction and reflection: and we are called upon to admire the multitude of hints, inquiries, and observations, which are dispersed up and down his works, without forming integral parts of his system.

the objects of our mental conception, do not exist *per se*<sup>u</sup>. Nature is also the *internal* principle of change in objects, and this constitutes a distinction between her works and those of art. The knowledge of nature is properly the knowledge of the laws of bodies, so far as they are in movement. In this science are comprised the following subjects of discussion: Nature, Cause, Accident, End, Change (and its subdivisions), Infinitude, Space, and Time: and moreover a general theory of movement. Nature, as a principle of change, does nothing without an end or object; which end is *the Form*<sup>z</sup>. When we speak of chance (τὸ αὐτόματον), we always in fact mean real causes, unknown to ourselves. All change necessarily presupposes a subject-matter (ὑποκείμενον, ὕλη): and a form (εἶδος). A change (κίνησις, μεταβολή), is the realization of that which is possible (ἐντελεχεία)<sup>y</sup>, so far as it is possible, ἢ τοῦ δυνάμει ὄντος ἐντελεχεία ᾗ τοιούτου<sup>z</sup>. As soon as the Possible (δυνάμει ὄν) assumes a certain form and is developed after a particular manner, every other condition and state is excluded (στέρησις). Matter, Form, and Privation, are therefore the three principles, or elements of existence and of change. Change is possible in respect of Substance, Quantity, Quality, and Place. This last condition, and *generally* that of space and time, serve as a foundation for the others<sup>a</sup>. Place (τόπος), is the first immoveable limit of that which surrounds us: (τὸ τοῦ περιέχοντος πέρας ἀκίνητον πρῶτον)<sup>b</sup>; there is no vacuum (κενόν). Time is the measure or numeration (ἀριθμός), of movement, with reference to priority and posteriority (ἀριθμός κινήσεως κατὰ τὸ πρῶτον καὶ ὕστερον<sup>c</sup>. Infinitude is that which continually

<sup>y</sup> Cf. SUIDAS, sub hâc v. Cf. also FATHER ANCILLON, Critical and Philosophical Researches respecting the Entelechia of Aristotle, in the Mem. of the Royal Acad. of Prussia (Class of Phil.), for the years 1804—11, Berl. 1816, p. 1, sqq. (Fr.).

<sup>a</sup> Phys. III, 1; VIII, 1.

<sup>b</sup> Ibid. III, 1; VII, 7; VIII, 7.

<sup>b</sup> Ibid. IV, 4, sqq.

<sup>c</sup> Ibid. IV, 11.

suggests the idea of still greater extent, in addition to that already ascertained. In reality there is no being which can be called Infinite; only in our conception. Time is infinite, Body and Space are finite, although susceptible of infinite division<sup>d</sup>. Motion in general, like time, has neither beginning nor end. Nevertheless it must be supposed to have a first cause of movement, itself unmoved (τὸ πρῶτον κινῶν ἀκίνητον). This source of movement must be eternal and invariable; its essence is eternal and pure, activity and life: such a cause is the Divinity. The first thing put in motion from eternity was the Heavens <sup>e</sup>.

144. *Cosmology*. The world (κόσμος, οὐρανός), is the sum total of all things subject to change. Beyond its limits is neither change, nor time, nor space. Itself is eternal and immoveable<sup>f</sup>. The First Being, who is the author of all movement, is not himself a part of the world. The latter is a whole, bounded by the heavens, without beginning or end, and of a spherical form. The earth is the central point, the heavens the circumference. Hence arise three simple movements; towards the centre (the gravitation of bodies towards the earth); from the centre to the circumference (light bodies, for instance, fire); and finally *about* that centre (the circumambient bodies, the heavens, etc.). The circular motion is the most perfect, and the upper region of the heavens in which it prevails is perfect and divine; indestructible, not subject to suffering or change; and consequently of a nobler nature than sublunary parts. The elementary matter of the constellations is the principle of all life, action, and thought in the inferior region; and all things here are subject to its influence and direction. The constellations are animated beings (ἐμψυχα); their principle of motion is within themselves, although they revolve in the circle to which they

<sup>d</sup> Phys. III, 1—7; VI, 1—9.

<sup>e</sup> Ibid. VIII, 5, sqq.; De Cælo, II, 3, sqq.

<sup>f</sup> De Cælo, I, 12.

are attached. In general, this part of Aristotle's system is obscure and inconsistent, and appears to waver between two opposite doctrines<sup>ε</sup>.

145. *Physiology* is indebted to Aristotle for its first cultivation; for an essay, imperfect indeed, but built upon experiment associated with theory. The soul he pronounced to be exclusively the active principle of Life; the primitive form of every body capable of life, i. e. *organized*; (ψυχὴ ἐστὶν ἐντελεχεία ἢ πρώτη σώματος φυσικοῦ ζῶν ἔχοντος δυνάμει<sup>β</sup>). The soul is distinct from the body: but considered as its form (εἶδος or ἐντελεχεία), it is inseparable therefrom<sup>ι</sup>. The faculties (δυνάμεις), of the soul are: Production, and Nutrition<sup>κ</sup>, Sensation<sup>ι</sup>, Thought (τὸ διανοητικόν), and Will or Impulse. Notwithstanding, Aristotle maintains the unity of these faculties in one soul, and rejects the notion of a plurality of souls. His remarks on the characteristics of our means of knowledge, that is the senses, are deserving of particular attention<sup>μ</sup>; as well as his observations on the Common Sense, (κοινὴ αἴσθησις); and on Consciousness (the existence of which he was the first distinctly to recognise<sup>ν</sup>); on Imagination (φαντασία), Memory (μνήμη<sup>ο</sup>); and Recollection (ἀνάμνησις.) Perception is the faculty which conveys to us the forms of objects: Thought is the perception of forms or ideas by means of ideas; which presupposes the exercise of Sensation and Imagination<sup>ρ</sup>. Hence a passive (παθητικός), and an active Intelligence (ποιητικὸς νοῦς). The last is imperish-

able (Immortality independent of Conscience or Memory<sup>9</sup>). The thinking faculty is an energy distinct from the body, derived from without<sup>r</sup>, resembling the elementary matter of the stars<sup>s</sup>. The understanding becomes Theoretical or Practical, according to its application, and, together with the Will, determines our actions. The Will (θέλεις), is an impulse directed towards matters of practice, that is to say, toward Good; which is real or apparent, acting as it procures a durable or a transient enjoyment<sup>t</sup>: θέλεις is subdivided into βούλησις and ἐπιθυμία, the *Will*, properly so called, and *Desire*. Enjoyment is the result of the complete development of an energy: which at the same time perfects that energy. The most noble of all enjoyments is the result of Reason<sup>u</sup>.

† FÜLLEBORN, On the Metaphysics of Aristotle: in his Collect. fascic. V.

PETRI RAMI Scholarum Metaphysicarum lib. XIV. Par. 1566, 8vo.

*Primary* philosophy, treating of the nature of Being in the abstract, was an attempt of Aristotle's, the first which had been made, in the science since denominated Metaphysics. It was reasonable to expect that this attempt should be as yet an imperfect one. It contains an analytical statement of what he denominated the Categories (ten in number<sup>x</sup>), a title under which he comprised

<sup>s</sup> Cic. Acad. Quæst. I, 7.

<sup>t</sup> De An. III, 9—11; Eth. III, VI.

<sup>u</sup> Ethic. X, 4, 5, 8.

<sup>x</sup> The ten Categories, or *prædicamenta* of Aristotle, are: ἡ οὐσία, τὸ ποσόν, τὸ ποιόν, πρὸς τι, ποῦ, ποτέ, κεῖσθαι, ἔχειν, ποιεῖν, πάσχειν, Substance, Quantity, Quality, Relation, Place, Time, Situation, Possession, Action, Passion. Aristotle distinguishes between these and the Categoremata, or *Prædicabilia*,

and elucidated without much systematic order, the leading characteristics of Being, as apprehended by the Understanding and the Senses<sup>†</sup>. With this arrangement he connected the question of the First Being, and His properties (theology<sup>‡</sup>). God, the absolute cause of regular movement<sup>‡</sup>, is the perfection of Intelligence (νοῦς), to whom appertains, of his own nature, pure and independent Energy, and the most complete Felicity<sup>‡</sup>: He is immutable, and the end of all Nature<sup>c</sup>.

147. *Practical philosophy*, by the profound analysis of Aristotle, became a moral theory of happiness, on Empirical principles. The fundamental point was the idea of a sovereign good and final end. The final End (τέλος), is happiness (εὐδαιμονία, εὐπραξία), which is the result of the energies of the soul, ἐν βίῃ τελείῃ, in a perfect life<sup>d</sup>: such happiness being the highest of which our nature is capable. This perfect exercise of reason is virtue; and virtue is the perfection of speculative and practical reason: hence the subdivision of Intellectual virtue (διανοητικὴ ἀρετή), and moral (ἠθικὴ<sup>e</sup>). The first, in its per-

which have reference to the former, and are five in number: Ὅρος, γένος, εἶδος, διαφορά, ἴδιον καὶ συμβεβηκός (Top. I, 6.)

See HARRIS'S *Philos. Arrangements*, Edin. and Lond. 1775, 8vo.

fection, belongs to God only, and confers the highest degree of felicity; the second, adapted to human nature, is the perfection of reasonable will (ἔξις, *habitus*), the effect of a rational deliberation (προαιρετική\*), of which the principle is constantly to take the mean between two extremes (τὸ μέσον, μεσότης†). Moral virtue presents itself under seven principal characters, having reference to the different objects of desire or avoidance; (the cardinal virtues). To these are added certain virtues of a mixed character; and Justice, which in its most extensive signification may be said to embrace all the virtues. Under the head of Justice Aristotle comprehends Right also‡. Justice consists in rendering to each his due, and its operation may be explained by applying to it the Arithmetical and Geometrical proportions conformably to the two species, the *Distributive* and *Corrective*, into which he subdivided the virtue. To these must be added Equity, which has for its end the rectification of the defects of law§. Under the head of Right (δίκαιον), he distinguishes that appertaining to a family (οἰκονομικόν), from that of a city (πολιτικόν); dividing the latter into the natural (φυσικόν), and the positive (νομικόν).

§ C. A. DROSTE-HUELSHOFF, De Aristotelis Justitia Universali et Particulari, deque nexu, quo Ethica et Jurisprudentia junctæ sunt, *Bonn.* 1816, 8vo.

148. A perfect unity of plan prevails throughout his *Morals*, his *Politics*, and his *Œconomics*. Both the latter have for their end to show how the object of man's existence defined in the *Ethics*, viz. Virtue combined with Happiness, may be attained in the civil and domestic relations, through a good constitution of the state and household<sup>1</sup>. The state (πόλις), is a complete association of a certain number of smaller societies sufficient to provide in common all the necessities of life<sup>2</sup>. Intellectual influence alone should preponderate. The science of *Politics* is the investigation of means tending to the final end just mentioned: its principle is expediency, and its perfection the suitableness of means to the end. By this principle Aristotle would prove the lawfulness of slavery<sup>3</sup>; (*Pol.* I, 5). All education he refers to the ultimate end of political society.

149. Aristotle also rendered great services to philosophy by his investigations with regard to the elements of language; particularly in his treatise *περὶ ἑρμηνείας*: and by the first profound examination instituted of the principles of the fine arts<sup>m</sup>; the theory of which, agreeably to his system, he deduced from the imitation of Nature.

150. The first successors of Aristotle were, for the most part, skilful commentators on his doctrines, who endeavoured in publications under similar titles to restate more clearly what he had first advanced: the effect of which was that his system gradually withdrew farther and farther from that of Plato, and proportionably ap-

proached the limits of Materialism. The most distinguished of his immediate followers were *Theophrastus* of Eressus<sup>a</sup>; whom Aristotle himself had characterised as the most learned and the ablest of his auditors, and the most proper to be his successor and heir<sup>o</sup>: *Eudemus* of Rhodes, who, as well as Theophrastus, republished with very few alterations Aristotle's doctrines in Physics, Logic, and Ethics: *Dicæarchus* of Messana<sup>p</sup>, and *Aristoxenus* of Tarentum, the musician; both materialists in their opinions on psychology: the first considering the soul to be a vital energy, inherent in the body<sup>q</sup>: the latter believing it to be a symphony or harmony resulting from the body, analogous to those elicited from the chords of an instrument<sup>r</sup>. *Heraclides Ponticus* has been already mentioned (§ 138). Subsequently, we have occasion to remark, among the disciples of Aristotle, the follower and successor of Theophrastus<sup>s</sup>, *Strato* of Lampascus; who died about 270 B. C., and published, with more of original character about it, a system of Physics<sup>t</sup>, in which he referred the existence of all things to the productive energy of nature, acting unconsciously; which caused him to be considered by many an atheist<sup>u</sup>. We

have fewer details with regard to *Demetrius Phalereus*<sup>x</sup>, a follower of Theophrastus: as an orator and statesman he was sufficiently distinguished. As for those who came after, *Lyco* or *Glyco*, of Troas, the successor of Strato<sup>y</sup>, (about 270 or 268 B. C.), *Hieronimus* of Rhodes his contemporary<sup>z</sup>, *Aristo* of Ceos, the successor of Lyco<sup>a</sup>, *Critolaus* of Phaselis, who went to Rome as ambassador at the same time with Carneades<sup>b</sup>, and his pupil and successor *Diodorus* of Tyre—all we know of these Aristotelians is that they devoted their especial attention to the investigation of the supreme good<sup>c</sup>. After them, we are ignorant even of the names of the masters of the Peripatetic school, till the time of Andronicus (see § 183).

The system of Aristotle for a long time maintained its ground as distinct from that of Plato: subsequently, attempts were made to associate them, as identical; or by giving the superiority to one or other. In the Middle ages that of Aristotle, degraded to a system of formularies, became universally prevalent; till in the end it yielded to Platonism: not, however, without continuing to retain great influence, from the general adoption of its Logic<sup>d</sup>.

151. *Epicurus*<sup>c</sup> of the *demus* of Gargettos, near Athens, was born of poor parents. His father, who had settled at Samos, gained his livelihood as a schoolmaster, and his mother by divining. The constitution of Epicurus was feeble, and his education imperfect, but his talents were superior. A verse of Hesiod, and the works of Demosthenes awakened in him, while yet young, a spirit of inquiry. Soon after, he attended at Athens, but in a desultory manner, the lessons of Xenocrates the Academician, Theophrastus, and others. In his thirty-second year he opened a school at Lampsacus, which, five years after, he removed to Athens<sup>f</sup>; where he taught, in his garden, a system of philosophy which readily recommended itself by the indulgence it held out to sensual

<sup>f</sup> DIOG. LAERT. X. 15.

habits, combined with a taste for the refinements of social life, an abhorrence of superstition, and a tone of elegance and urbanity which blended with all his doctrines. He may be justly reproached with depreciating the works of other philosophers. Of his numerous writings<sup>s</sup> we possess only a few fragments cited by Diogenes Laertius, and the book *περὶ φύσεως*, which by a fortunate chance was discovered among the ruins of Herculaneum.

152. According to him, philosophy directs us to happiness by the means of reason<sup>h</sup>. Consequently, Ethics form a principal part of his system, and Physics, etc. are only accessories. He assigns the same inferior place to what he terms *Canonics*, the Dialectics of his system<sup>i</sup>. There is little originality in this theory of happiness; and the form alone in which it is put belongs to Epicurus. The theory is in fact nothing more than one of Eudæmonism, with a sprinkling of moral sentences, built upon an Atomic system by way of Physics; with a theology suitable to such a whole: a system which if rigorously pursued through all its consequences, could not fail of leading to immorality.

153. Epicurus borrowed from Democritus his theory of certain subtile emanations of objects (*ἀπόρροιαί, ἀποστάσεις*), which he supposes to detach themselves therefrom, and so disperse themselves through the air (§ 105). These, impressing the senses, produce on them corresponding images, and these again create the *mental* conceptions of the same; less perfectly representing the original objects. It is from the senses that we derive all our ideas, even those which are *universal*, and of which there existed previously what he termed *προλήψεις*<sup>k</sup>; the

understanding *contributing* however to their formation<sup>1</sup>. Every perception of the senses and imagination is true, because necessarily responding to the images impressed upon them, and the results are neither capable of being demonstrated nor refuted (ἐναργής, ἄλογος). Our opinions, on the other hand (δόξαι), are either true or false, according as they respond or not to our *sensible* impressions; wherefore these are always to be referred to as their *criteria*. Our sensations (πάθη), are our criteria with respect to what we ought to desire or to avoid (αἵρεσις and φυγή). There is no law of necessity for thought; or a Fatalism would be the consequence. Such are the principles of his Canonics<sup>m</sup>.

*Morals.* Pleasure is the sovereign good of man; for all beings from their birth pursue pleasure and avoid pain. Pleasure consists in the activity or the repose of the soul; in the enjoyment of agreeable sensations, and the absence of those which are painful (ἡδονὴ ἐν κινήσει, and ἡδονὴ καταστηματική). Epicurus regarded this well-being as the end of man's existence; and pronounced the *sum-*

*num bonum* to be a state exempt from suffering, the result of the satisfaction of all our necessary, and natural desires<sup>a</sup>. All our sensations, in themselves are equal in worth and dignity, but differ greatly in intensity, duration, and their consequences. The pleasures and the pains of the mind exceed those of the body. To attain happiness, therefore, it is necessary to make a choice (*αἵρεσις*); and to rule our desires by the help of reason and free-will, or individual energy independent of nature, which Epicurus explains in a manner not the most philosophical<sup>o</sup>. Consequently Prudence (*φρόνησις*), is the first of virtues: next to that Moderation and Justice. Virtue in general has no value or worth but for the consequences which attend her; namely, that she is inseparably allied to enjoyment<sup>p</sup>. *Contracts* are the origin of Right: their end is the mutual advantage of the contracting parties, and expediency the principle which makes their performance obligatory<sup>q</sup>. Occasionally Epicurus took higher ground<sup>r</sup>; with the same inconsistency which compelled his adversaries to praise the *life* he led; so much at variance with the spirit of his precepts<sup>s</sup>.

*Observation.* A difference is to be observed between the system of happiness adopted by the Cyrenaics and that of Epicurus; who appears to have made his more perfect, in proportion as he became gradually more alive to the deficiencies of the former. See DIOG. LAERT. X, 6, 131, 137. CIC. Tusc. Quæst. III, 18; Fin. I, 17.

totle and Epicurus on Philosophy, *Lugd. Bat.* 1682, 12mo. (French).

*Physics.* He considered the science of Physics as subordinate, in some sort, to that of Morals; and that its proper end was to liberate mankind from all superstitious terror derived from their conceptions of the celestial phenomena, the Gods, Death, and its consequences; i. e. from vain apprehensions affecting the living<sup>1</sup>. With these views, Epicurus found nothing which suited him better than the Atomic theory, which he enlarged by adding a great number of hypotheses, and applied to explain different natural phenomena. If we admit the objects presented to our senses to be compound in their nature, we are led to presume the existence of simple uncompounded bodies, or Atoms. Besides weight, form, and volume, and that which he considered to be the primitive movement common to all, viz. a perpendicular, he assigned to them also an oblique motion<sup>2</sup>, without adding any proof. The various mechanical movements of Atoms *in vacuo* (τὸ κενόν), or space (τόπος), have produced *aggregates*, or bodies, and even the universe itself; which is a body, and which, considered as a whole, is immutable and eternal, though variable and perishable in respect of the parts, or worlds, of which it is composed<sup>3</sup>. The world being imperfect and presenting nothing but scenes of misery, destruction, and death (imperfections especially observable in Man), cannot be considered the work of an Intelligent Cause. Besides, such an origin is irreconcilable with the tranquil and happy lot of the Gods<sup>4</sup>. All the appearances of final causes which are observable in the world are purely fortuitous<sup>5</sup>. The soul is of a corporeal nature, as is attested by its sympathy with the body: but at the same time of a nature more

refined, involved in one less perfect. Its elemental principles are heat, the ether spirit, and an anonymous matter on which depends its sensibility: this last is situated in the breast, the others dispersed over the body<sup>a</sup>. The soul and the body are united in the most intimate manner; the latter is born with the body, and perishes with it, by the dissolution of its component Atoms<sup>b</sup>. To suppose the soul immortal is to contradict all our notions of the characteristics of an immutable and eternal being<sup>c</sup>. By such arguments Epicurus would disprove the immateriality of the soul, which Plato had maintained. Death he affirmed to be no evil<sup>d</sup>.

**Dogmatism.** He concludes that they exist, from the universality of a Religious belief; which according to his system, is the *Effluence* of certain real objects. The Gods are compounded of Atoms, and bear the human shape, the most perfect of all figures, their substance being analagous to that of our bodies, without being altogether the same: they are eternal, imperishable, and supremely happy: as such they are worthy of our worship, although they inhabit the space intermediate between the Worlds, in a state of repose and indifference, in which their felicity consists, and without exerting any influence over the affairs of this lower region.

157. Epicurus had a great number of disciples, among whom we remark *Metrodorus*<sup>s</sup> and his brother *Timocrates*, *Colotes* (the same against whom is directed a treatise of Plutarch), *Polyænus*, *Leonteus* and his wife *Themista*, all of Lampsacus; add to these another *Metrodorus* of Stratonicea, who subsequently went over to the Academy<sup>h</sup>: and the friend and confidant of Epicurus, *Leontium*, the noted courtesan of Athens; next came *Hermachus* of Mitylene, the successor of Epicurus<sup>i</sup>; and, at a later period, *Polystратus*, *Dionysius*, *Basilides*, *Apolodorus*, *Zeno* of Sidon, *Diogenes* of Tarsus, *Diogenes* of Seleucia, *Phædrus* and *Philodemus* of Gadara, etc. His school subsisted for a long time without undergoing any important modifications<sup>k</sup>: of which the reason probably was, the spirit of the system itself, and the deference entertained by his followers for their master. He had, besides, guarded his doctrines against any considerable innovation by founding them on formal propositions, or general maxims (κύριαι δόξαι<sup>l</sup>). If on the one hand this system had a tendency to extinguish all belief in the

157. *Zeno* was born at Cittium, in Cyprus<sup>n</sup>; his father Mnaseas being a rich merchant. Having received a good education, chance, added to his own inclinations, caused him to attend the Socratic schools. He became a hearer of the Cynic Crates, Stilpo, and Diodorus Cronus the Megareans, and the Academicians, Xenocrates and Polemo, for several years. His object was to found a system of Human instruction which might oppose itself to

<sup>m</sup> LUCIAN. Alexander.

<sup>n</sup> About 340 B. C.

Scepticism; and, in particular, to establish rigid principles of Morality, to which his own conduct was conformable. In the Portico (στοά), at Athens, he formed a school<sup>o</sup>, distinguished for a succession of able philosophers, and lovers of virtue; a school which became memorable for the influence it possessed in the world, and its resistance to vice and tyranny. Zeno died after Epicurus<sup>p</sup>. His system was extended, developed, and completed in the course of a long rivalry with other schools, particularly that of Epicurus and the New Academy. Its principal supporters were *Persæus* or *Dorotheus* of Cittium<sup>q</sup>, *Aristo* of Chios<sup>r</sup>, who founded a separate school approaching that of the Sceptics<sup>s</sup>, *Herillus* of Carthage<sup>t</sup>; and lastly, the pupil and worthy successor of Zeno, *Cleanthes* of Assos<sup>u</sup>. Next came the disciple of the last, *Chrysippus* of Soli or of Tarsus, the pillar of the Portico<sup>x</sup>; then his disciple *Zeno* of

Tarsus<sup>γ</sup>, and *Diogenes* of Babylon, who with Carneades and Critolaus went as ambassador to Rome about 155 B. C.; still later came *Antipater* of Tarsus or Sidon<sup>α</sup>, *Panætius* of Rhodes, who succeeded him at Athens, but also taught at Rome, and accompanied Scipio Africanus to Alexandria<sup>α</sup>; and lastly, *Posidonius* of Apamea in Syria, a pupil of the former, and surnamed the *Rhodian*, from the school which he established at Rhodes<sup>β</sup>. Even after an examination of all the historical authorities relative to the philosophers of this sect, it is no easy matter to assign to each his respective part in the composition of its doctrines. On the present occasion we can only find room for the principles and general characteristics of the system.

159. According to the Stoics, philosophy is the science of human perfection (*σοφία*, wisdom), which develops itself in thought, knowledge, and action. Its three principal subdivisions are Logic, Physiology, and Ethics. The latter is the most important, the others subordinate. The Stoics were not able to digest these into a systematic form, founded on solid principles; because they pursued the theory of Empiricism; their fundamental maxim being—to follow Nature<sup>ε</sup>.

160. The Logic of Zeno and his successors was of

much more extensive application than that of Aristotle: forming a considerable part of the wisdom he professed to teach, and being adapted *ad materiam* as well as to the *form* of argumentation; and comprehending in its range as subordinate to itself, something of Psychology, Grammar, and Rhetoric. Such a system of Logic was intended to oppose to the uncertainty and the instability of popular notions a solid and stable science, worthy of a philosopher; and which might serve him as a touchstone of Truth and Falsehood. It rested on the theory of perceptions. Every original perception is the result of impressions produced upon the mind, and is therefore denominated *φαντασία*, *visum*. Out of these original and *sensible* impressions Reason, a superior and directing power (*τὸ ἡγεμονικόν*), forms our other notions and opinions. The *true* are styled by Zeno *φαντάσiai καταληπτικαί*, or *καταλήψεις*, that is, such as are verified by their correspondence with the object to which they refer, are freely assented to, and constitute the foundation of science. The rule of Truth, accordingly, is Right Reason, *ὀρθὸς λόγος*, which conceives of an object as it is. On this Dogmatic Empiricism rested the system of Zeno. Chrysippus remarked with still greater exactitude the difference between sensible impressions (*αἰσθητικαί*), and those which are not derived from the senses. The latter i. e. *ideas* result from the mutual comparison of the former, and by combining whatever they contain of *Universal*. This union takes place sometimes involuntarily, sometimes in consequence of a voluntary application of the understanding; and hence result, on the one hand, natural ideas (*φυσικαὶ ἔννοιαι καὶ προλήψεις*), and on the other notions artificially acquired (*ἔννοιαι*). Of these the former constitute the *Sensus communis* (*κοινὸς λόγος*), which is the criterium of Truth<sup>d</sup>. The versatility, or as it may be termed the subtilty of the mind of Chrysippus, displayed itself especially in the manner in which he perfected the Syllo-

TH. A. SUABEDISSEN, *Programma: cur pauci semper fuerint Physiologiæ Stoicorum Sectatores*, *Casel.* 1813, 4to.

Zeno attempted, in his Physiology, to give such an account of the notions commonly received respecting the objects of the natural world, as, without the substitution of any hypothesis, might afford a foundation for practical judgment. Of all preceding systems, that of Heraclitus, which supposed the existence of an all-pervading λόγος, appeared to Zeno to suit his purpose best, and agreed with his doctrine that immaterial beings are nothing more than chimeras<sup>e</sup>. According to the Stoics all that is real—all that can act or suffer is corporeal. They make a distinction however between solid bodies (στερεά), and the contrary. Space, Time, and Ideas are incorporeal<sup>f</sup>. Chrysippus also distinguished between Space and Vacuum; and pronounced the latter, like Time, to be infinite. There are two eternal principles (ἀρχαί), of all things: the one (ἔλῃ)<sup>g</sup>, matter, passive; the other active, namely the Divinity, or creative principle; the source of activity, and author of the forms and arrangement of all things in the world. God is a living fire, unlike however to common fire; he is named also πνεῦμα or *spirit*<sup>h</sup>; he fashions, produces, and permeates all things, agreeably to certain laws (λόγοι σπερματικοί). *Matter* is thus subject to universal reason, which is the law of all nature<sup>i</sup>.

Various proofs of the existence of a Divinity were

alleged by the Stoics, particularly by Cleanthes and Chrysippus<sup>k</sup>.

According to the doctrines we have reviewed, God is *in*, not *without* the world. The world itself is a living being and divine. Hence resulted the close connection maintained by these philosophers between Providence (*προνοία*) and Destiny (*εἰμαρμένη*), founded upon the relations between Cause and the Effect observable in the world<sup>l</sup>: this notion led Chrysippus still farther, to *Determinism*; and thence to *Optimism*<sup>m</sup>, to *Divination* (*μαντική*), and an attempt to explain the Mythological Polytheism by the aid of Physiology and Theology<sup>n</sup>. In like manner as the world was produced by the action of fire, when the four elements (*στοιχεῖα*), out of which the Divinity formed all things, were separated from primeval matter<sup>o</sup>; so must it ultimately perish by the same<sup>p</sup>. This combustion or dissolution by fire, by which all things will be resolved into their original state (*ἐκπύρωσις τοῦ κόσμου*) has been rejected by some subsequent Stoics<sup>q</sup>, among others by Zeno of Tarsus, Panætius, and Posidonius<sup>r</sup>.

162. The soul is an ardent spirit (*πνεῦμα ἔνθερμον*), being a portion of the Soul of the world, but, like every other real individual being, is corporeal and perishable<sup>s</sup>. Cle-

anthes and Panætius went so far as to endeavour to establish its mortality by proof<sup>1</sup>. It consists of eight parts or powers: one, and the principal (τὸ ἡγεμονικόν), or Intelligence (λόγισμος), is the source of all the rest, namely, the five senses, speech and the generative faculty; in the same manner as the Divinity is the origin of all individual energies in the world without<sup>2</sup>. The emotions also, as well as the passions and appetites of the soul (πάθη and ὀρμαί), are the results of the intellectual faculty; because they are always founded on some belief of the reality of their object, on some approbation, or judgment<sup>3</sup>.

The morality of the Stoics was built upon profound observation of the essential characteristics of human Nature, of Reason, and Free-will; and a close association of the laws of Practice with those of Nature<sup>4</sup>, in virtue of this principle, that God, the inherent cause of all the existing forms and proportions of the world, is himself the supreme Intelligence and Law. In consequence of the Rational nature of Man, the Stoic considers Order, Legality,

<sup>4</sup> CIC. De Nat. Deor. I, 14.

and Reason, as what we are above all things bound to respect, as the only condition on which man can attain to the end of his being, that is Virtue; towards which all Nature is framed to lead us. Accordingly the first of all maxims is <sup>a</sup>: *To live agreeably to the law of Right Reason* (ὀρθὸς λόγος); or according to the formulary of Cleanthes and other Stoics: *To live conformably to Nature*, (ὁμολογουμένως ζῆν, or ὁμολογουμένως τῇ φύσει ζῆν) <sup>a</sup>. See above Polemo (§ 138). Such a life is the proper end of Human existence <sup>b</sup>.

164. The most remarkable principles of the *Practical* system of this school are: 1st. τὸ καλόν, (or Virtue), is the only absolute good: Vice, on the other hand, is the only positive evil: every thing else is morally indifferent, (ἀδιάφορον), possessing only a relative value, which renders it in a greater or less degree capable of becoming an object of choice, of avoidance, or simply of toleration, (ληπτὸν, ἀληπτὸν, μέσον <sup>c</sup>). 2dly. All actions are conformable or unconformable to the character of the agent, καθήκοντα, παρὰ τὸ καθήκον: the first being subdivided into καθήκοντα τελεῖα, and κ. μέσα; the former, inasmuch as they are done in fulfilment of the law, are called *good actions*, κατορθώματα, and their contraries, transgressions, ἀμαρτήματα. The κατορθώματα alone are virtuous and worthy of commendation; without respect to their consequences <sup>d</sup>. 3dly. Virtue is founded on Prudence (φρόνησις); it consists in a Rational and Spontaneous practice, consistent with itself, and with Nature; having for its object the knowledge and the performance of what is good <sup>e</sup>: Or, again, Virtue is a system of conduct regulated by the principle, that no-

thing but the practice of good is good, and that therein alone consists the character of true liberty<sup>f</sup>. Vice is an inconsistent mode of action, (*inconstantia*), resulting from the neglect or the perversion of reason: the evil passions accompanying which are voluntary and blameable<sup>g</sup>. 4thly. Virtue being the only good, can alone enable us to attain felicity<sup>h</sup> *εὐδαιμονία*: which latter consists in a tranquil course of life, (*εὐρρήσια βίον*), and cannot be augmented by any increase of duration<sup>i</sup>. 5thly. Virtue is one, and Vice is one: neither of them are capable of augmentation or diminution<sup>k</sup>. All good actions are respectively equal, and in like manner all evil, inasmuch as they flow from the same sources. Virtue is manifested under four principal characters: Prudence, (*φρόνησις*); Courage, (*ἀνδρεία*); Temperance, (*σωφροσύνη*); Justice, (*δικαιοσύνη*): with a corresponding number of Vices<sup>l</sup>. 6thly. The Virtuous man is exempt from Passions (*πάθη*), but not insensible to them. It is in this sense that we must understand the *ἀπαθεία* of the Stoics<sup>m</sup>. The Passions ought to be not

moderated but eradicated. The Wise man alone is free. Chrysippus mainly contributed to systematise the Ethics of the Stoics, and asserted that the principle of Right was founded *in the nature of Reasonable Beings*, (φύσει καὶ μὴ θέσει δίκαιον): and derived from this the characteristics of Natural Right.

165. The Stoics admitted only two descriptions of men; the good, σπουδαῖοι; and the bad, φαῦλοι: without allowing the existence of any intermediate class. With such a view they drew a portrait of their ideal Wise man<sup>n</sup>; with all the most sublime features of moral and intellectual perfection, but without a sufficient observation of the differences which must necessarily exist between the ideal image and the reality; and more as if they were describing the qualities of a superior nature, than a degree of perfection attainable by man<sup>o</sup>. On the same principle they permitted their Wise Man, under certain circumstances, to deprive himself of life (αὐτοχειρία), as a part of his absolute freedom<sup>p</sup>. In later times this licence was made still greater, particularly by the authority of Seneca<sup>q</sup>. The blending of the moral system of the Stoics with their views of Physics and Theology, and an imperfect estimate of the distinctions which form the limits between the Law of Nature and Free-will, Morality and Felicity, gave occasion, in this system, to many inconsistencies which are easily observable; especially in their ideas of absolute liberty, and the incompatibility of this entire independence with Fate<sup>r</sup>. The system bears also throughout a character of extravagant pride and asperity, which is hostile to the cultivation of moral sentiment. On the other hand, we find abundant germs of noble

166. The bold and uncompromising Dogmatism which prevailed in the Porch, and the bitter attacks made by Zeno and Chrysippus on the founder of the Academy<sup>s</sup>, induced the successors of the latter to investigate, after a more scrupulous manner, the prevailing Dogmatical systems, and in particular, that of the Stoics. The consequence was a habit of *doubting* in philosophical inquiries; a habit which characterised a whole class of Academicians, in opposition to the practice of the original school: hence the *New Academy*; the founder of which was Arcesilaus of Pitane, in Æolia<sup>t</sup>. This is sometimes called the *Second* or the *Middle Academy*, with reference to the one which followed. After having previously applied himself to the study of Poetry, Eloquence, and the Mathematics, this philosopher attended, at Athens, Theophrastus, and afterwards Polemo. Crantor and Zeno were his fellow disciples under the latter: and their methodical and innovating spirit incited him to contradiction. He subsequently took the place of Sosicrates, as Chief of

<sup>s</sup> DIOG. LAERT. VII, 32.

<sup>t</sup> Born 318 or 316 B. C.

the Academy, and died 241 or 239 B. C. He was a philosopher of extensive knowledge, of great ability in Dialectics, and of stainless morals.

167. The character thus introduced, by a spirit of doubt, into the Academy, was one of Diffidence; which tended to circumscribe the pretensions of Philosophy, without denying the possibility of certain, or at least, of probable knowledge. In this manner, by the subtilty of his Logic, Arcesilaus brought into question the principal Dogmatical doctrines, in order to open the way for more profound inquiries; and to this end introduced into the Academy the method of *Disputation*<sup>u</sup>. He attacked, above all, the *φαντασία καταληπτική*, as it was termed, which Zeño taught, and admitted as a *criterium in thesi*, while at the same time he denied it *in hypothesis*<sup>x</sup>. Constantly opposing himself to the opinions of his adversaries, he was drawn into a general Scepticism with regard to our knowledge of the Absolute Existence and nature of things<sup>y</sup>; so much so, that he denied the reality of any adequate *criterium* of Truth, and recommended, as a quality of wisdom, a suspension of all definitive Judgment<sup>z</sup>. In *Practical* philosophy, he maintained that the safest rule was the principle of Conformity to Reason; τὸ εὐλογον<sup>a</sup>. His immediate followers were *Lacydes* of Cyrene, *Evander* and *Telecles*, both of Phocis; and *Hegesinus* of Pergamus<sup>b</sup>.

168. But a much more distinguished personage followed in Carneades of Cyrene<sup>c</sup>. He attended at first the school of the Stoics; afterwards he became the pupil

and successor of Hegesinus at the Academy; and having been sent a deputy to Rome<sup>d</sup>, he excited universal admiration by his eloquence and his logic<sup>e</sup>. This philosopher, who has by some been considered the founder of a *Third* Academy, directed his Scepticism more especially against Chrysippus, with great oratorical and argumentative talent. Taking into consideration the twofold relation of the φαντασία, to the object (τὸ φανταστόν), and the subject (φαντασιούμενος), he concluded that there could be no real knowledge of any object, inasmuch as neither the senses nor the understanding afford a sure testimony (κριτήριον) of its truth; and maintained that all that can be inferred is *probability*<sup>f</sup> (τὸ πιθανόν); in three distinct degrees: ἔμφασις, or πιθανὴ φαντασία: ἀπερισπαστός: and διεξωδευμένη ἢ περιωδευμένη φαντασία<sup>g</sup>. In this consists the system of *Probabilities* of Carneades (εὐλογιστία). He attacked the Theology of the Stoics in detail: proving that the Divinity cannot be conceived of as a ζῷον: and that we cannot apply to him our ideas of Existence and Morality. He exposed, in like manner, by victorious demonstration, the fallacies attending the practice of attributing to the Deity a human form<sup>h</sup>. He defended against the Stoics, the existence of a Particular Natural Right; and, on the subject of the Supreme Good, opposed to theirs the opinion of a certain *Callipho*; who made it consist in Virtue united to Pleasure. He threw considerable light on practical morals, by comparing Civil with Natural Right; and Prudence with Morality; (making Prudence the principle of action;) but for want of solving the apparent contradictions between these two principles he did injury to the cause of Virtue, though his own charac-

ter was far from being opposed to it<sup>i</sup>. *Clitomachus* of Carthage, the disciple and successor of Carneades (129 B. C.), put the sceptical arguments of his master in writing<sup>k</sup>.

169. The Stoics were sensible of the danger which menaced the foundations of their system, but the only answer they were able to make was the reproach of inconsistency with which *Antipater* taxed the Academicians<sup>l</sup>, or they cut short their attacks by the downright assertion; That we ought not to endeavour to discover any new grounds of knowledge and certainty<sup>m</sup>. Nevertheless, Dogmatism and Scepticism in their respective schools, relaxed somewhat of their rigour, and a sort of reconciliation between them was brought about by *Philo* of Larissa and *Antiochus* of Ascalon<sup>n</sup>, his pupil and follower, who became a teacher at Athens, Alexandria, and Rome. The first was the pupil and successor of *Clitomachus*; he also taught at Rome, whither he retreated during the war of Mithridates, a hundred years B. C.; and by some he has been considered the founder of a *Fourth* Academy. He confined Scepticism to a contradiction of the Metaphysics of the Stoics and their pretended *criteria* of knowledge<sup>o</sup>: he contracted the sphere of Logic<sup>p</sup>: made Moral philosophy merely a matter of public instruction; and endeavoured to prove that the old and new Academies equally doubted the certainty of speculative knowledge<sup>q</sup>. *Antiochus* derived from the *Conscience* a strong argument against Scepticism<sup>r</sup>, to which

in his youth he was inclined. Consequently, he became an opponent of his master<sup>a</sup>: and in the end endeavoured to demonstrate the identity of the Academic, Peripatetic, and Stoic doctrines with respect to Morals<sup>t</sup>; maintaining that the differences were merely nominal. He has been improperly regarded by some as the founder of a *Fifth Academy*; for he rather approximated the doctrine of the Stoics; inasmuch as he admitted that there is a degree of certainty in Human Knowledge<sup>u</sup>; and rejected the system of *Probabilities* of the Academy. These two attempts at union were the prelude to many more<sup>x</sup>.

In his moral system, Antiochus treated self-love as the *Primum Mobile* of men and animals; considering its operation to be at first instinctive; and afterwards aided by consciousness and reason. In this respect he modified and tempered the Stoic principle<sup>y</sup>.

170. Thus was the debate between Dogmatism and Scepticism for a time suspended: and the latter, at least, ceased to be heard of in the Academy. It is true that all these disputes had not settled the grand point in question; whether there be any solid principle and foundation for knowledge in general, and, in particular, for Philosophic Knowledge: but by the observation of Moral Consciousness the disputants had come to the conclusion that something stable and certain in knowledge is necessary; and had drawn broader distinctions between what belongs to the subject (man), and what relates to the external object.

The four great philosophical factions continued to maintain at Athens their several schools, close by each other, without mutually interrupting their discussions; and prosecuted, but with less vivacity than of old, their ancient disputes.

## CHAPTER THIRD.

ON THE PHILOSOPHY OF THE ROMANS, AND THE NEW SCEPTICISM OF ÆNESIDEMUS, DOWN TO THE TIME OF JOANNES DAMASCENUS (FROM 60 B. C.—TILL THE END OF THE EIGHTH CENTURY). (THIRD EPOCH OF GRECIAN PHILOSOPHY.)

*Propagation and Downfal of Grecian Philosophy.**General Sketch.*

171. Scepticism, after it had lost much of its influence in the Academy, re-appeared in the schools of Medicine: where it called forth fresh inquiries on the part of those who were inclined to more *positive* doctrines: inquiries which were fostered by the increased intercourse which had taken place between the Orientals and the Greeks, as well as by some other great external events, such as the conquests of Alexander and the Romans, and, subsequently, the growth of Christianity. Combined with other causes, these events contained the principle of the decline and fall of Grecian philosophy, at the same time that they laid open new paths to the spirit of Philosophic research.

172. Alexander<sup>a</sup> had annihilated the republican liberty of Greece and subdued to the Grecian arms, together with Egypt, the whole of Asia, as far as the Indus: thus opening the way for an active commerce between the East and the West, which contributed to enlarge the sphere of Grecian art and science. Alexandria, that mighty commercial city which gradually succeeded to the importance of fallen Athens, strengthened these distant relations, and helped to convert them to the interests of science. The Ptole-

<sup>a</sup> Died 323 B. C.

mies, the successors of Alexander in Egypt<sup>b</sup>, aided the cause of knowledge by founding their famous Library and Museum; although original inquiry appears to have been damped by this vast accumulation of scientific resources, and the facility with which they were accessible. A progressive decline became observable in the Spirit of Philosophy, which was gradually directed to humbler objects, of a more pedantic character; such as Commentaries, Comparisons, Miscellanies, Compilations, etc. etc.

Reference may be made to :

### § 173.

See the Works mentioned § 38.

The Romans, a nation of mere warriors and conquerors, with whom the interests of their Republic outweighed all others, became acquainted with Grecian philosophy, particularly with the Peripatetic, Academic, and Stoic doctrines, only after the conquest of Greece; and more especially through the intervention of three philosophers whom the Athenians deputed to Rome<sup>c</sup>. In spite of determined prejudices and reiterated denunciations<sup>d</sup>, one of these doctrines (that of the Academy), daily gained disciples there; especially when Lucullus and Sylla had enriched the Capital with conquered libraries. The latter, after the capture of Athens, 84 B. C., sent thither the collection of Apellicon, which was particularly rich in the works of Aristotle.

<sup>b</sup> Third century B. C.

DAN. BOETHII *Digest. de Philosophiæ nomine apud Veteres Romanos in-viso*, *Upsal.* 1790, 4to.

<sup>d</sup> A. GELL., N. A. XV, 11.

The Romans almost always looked upon philosophy as a mean to attain some personal or political end: betraying by that very circumstance their want of a genuine philosophic spirit. Nevertheless they eventually became the depositaries of Grecian philosophy.

174. Christianity, the religion of the "Pure in Heart," which prescribed a disinterested love of our neighbours, and proclaimed to all mankind, without any outward display of philosophy, the reconciliation of God to Man, afforded, as it were, a fresh text, of the highest interest; which was no less capable of being enforced by reason than by revelation. It has exercised a various influence over the progress of Philosophical Reason, by the matter of its doctrines, as well as by their form.

175. The Spirit of research of Grecian Philosophy, once so original and independent, was exhausted. Reason had tried every path, every direction then open to her, without being able to satisfy herself: because she had not advanced to the original sources of knowledge, and consequently had continued an enigma to herself. The different philosophic systems had viewed truth only in one of its aspects; and consequently were involved in errors. The want of philosophical method had rendered the disentanglement of these errors the more difficult; and a reconciliation or adjustment had become impossible between the different sects, whose disputes, while they prevented the understanding from sinking into lethargy, had also the effect of detracting from the pure and disinterested love of Truth. Consequently, the efforts of Science were not so much directed to the investigation of the first principles of knowledge, as to maintain, consolidate, illustrate, and apply conclusions which had been already drawn.

176. The political, religious, and moral condition of the Roman Empire during the first centuries after the Christian era, were not such as to animate and sustain a spirit

of philosophical research. Greece had lost her political existence; Rome her republican constitution. Beginning with the Capital, Luxury, Egotism, and Indolence, had spread their reign to the remotest provinces. The characteristic features of the period were a neglect of the popular religion; a preference for foreign rites; (of which an incongruous medley was tolerated); a widely prevalent superstition; a disdain of what was Natural; a mania for what was strange and extraordinary: a curious prying into the (pretended) occult arts; with an extinction of all sentiments truly great and noble. Such are the characteristics given by the Epicurean Lucian of Samosata (2nd. cent. A. C.) in a Satire, which exposes with the most poignant ridicule the false philosophy of his age. (Cf. § 181).

See † CHPH. MEINERS, History of the Decline of Morals under the Roman Government, *Leips.* 1782, 8vo.

177. Consequently the efforts of the understanding were directed in various ways, and tended: 1st. To maintain the Schools and Systems already existing; not without considerable modifications. 2dly. To revive superannuated doctrines, such as those of the Pythagorean and Orphic philosophies. 3dly. To combine by Interpretation, Syncretism, or Eclecticism,\* the various systems; especially those of Plato and Aristotle; and to trace them all back to the ancient Dogmata of Pythagoras, the pretended Orpheus, Zoroaster, and Hermes\*. 4thly. To combine in one the Spirit of Oriental and Occidental philosophy.

178. Nevertheless philosophy made at least some apparent progress, and extended the outward limits of her reign, if she did not improve the territory she had already acquired. The Romans and the Jews by this time had made themselves acquainted with the doctrines of the

\* [*Syncretism* professes to combine the elements of different systems: *Eclecticism* to select from all what is consistent with truth. *Trans.*]

\* Cf. L. E. OTTO BAUMGARTEN-CRUSIUS, *De Librorum Hermeticorum origine atque Indole*, *Jen.* 1827, 4to.

Greeks, and had produced some philosophical works sufficiently original. Nor does this progress of philosophy appear to have been merely external; inasmuch as Scepticism assumed a more decided character, and gave occasion for a fresh Dogmatical system in the school of the Platonists. By imagining a new source of knowledge, consisting in the contemplation of that which is absolute; by labouring to combine the old and the new theories of the East and the West, they endeavoured to provide a broader basis for Dogmatic philosophy, to prop up religion, and to oppose a barrier to the rapid progress of Christianity; but eventually lost themselves in the dreams of Metaphysics. On the other hand the Doctors of the Catholic Faith, who at one time had rejected and contemned the philosophy of the Greeks, ended by adopting it, at least in part, in order to complete and fortify their religious system. The invasions of the barbarous tribes, and the disunion of the Eastern and Western empires brought on at last an almost utter extinction of Philosophical research.

*Introduction and Cultivation of Grecian Philosophy  
among the Romans.*

179. Unquestionably the national character of the Romans, more disposed for action than speculation, did not encourage philosophy to spring up among them unassisted<sup>f</sup>. The revolutions also in their government, the loss of their republican constitution, the tyranny of the greater part of their emperors, and the general and continually increasing corruption were little favourable to the development of a truly philosophical spirit, yet from time to time they manifested a degree of interest in such researches, which they looked upon as indispensable to a cultivated mind, and as serviceable for certain civil offices. Agreeably to their native character and habits

<sup>f</sup> K. F. RENNER, *De Impedimentis, quæ apud Vett. Romanos Philosophiæ negaverint successum*, Hal. 1825. See also the authors mentioned at the head of § 24, b.

they showed more predilection for the doctrines of the Porch or of Epicurus, than those of Plato and Aristotle; which were of a more speculative character. The Romans thus applied themselves to Grecian philosophy; successfully transferred into their own language some of its treatises; enriched by the application of them their jurisprudence and polity, but did not advance a step by any original discovery of their own. Consequently, we can distinguish only a small number of Latins who have deserved a page in the history of philosophy. We shall proceed to mention the principal of those among them, who, whether Romans or foreigners, cultivated and diffused the philosophy of the Greeks, with some partial modifications in their manner of teaching it.

180. *M. T. Cicero*<sup>s</sup>, like many other young Romans of good family, was instructed by Greek preceptors. In order to improve himself in eloquence and the science of polity, he travelled to Rhodes and Athens; where he occupied himself with the pursuit of Grecian philosophy, directing his attention particularly to the Academic and Stoic systems. He owed, in part, his success as an orator and a statesman to the ardour with which he devoted himself to these studies. At a later period of his life, when his career as a statesman was closed by the fall of the Republic, with his characteristic patriotism, he consecrated his leisure to the discussion of points of philosophy; labouring to transplant the theories of the Greeks into his native soil: with little gratitude on the part of his countrymen<sup>h</sup>. In all speculative questions he maintained the freedom of opinion and the impartiality which became a disciple of the New Academy: following the *method* also of that school in the *form* of his writings. In questions of morality he preferred the rigid principles of the Stoics<sup>i</sup>; but not without doing justice to Plato, Aristotle, and even Epicurus, (as far as the correctness of his *life* was concerned<sup>k</sup>). His philosophical works, in which he appears to have made Plato his model, are a most valuable collec-

<sup>s</sup> Born at Arpinum, 107 B. C., died A. D. 44.

<sup>h</sup> Cic. Orat. pro Sextio. PLUTARCH. Vit. Cic. V.

<sup>k</sup> De Nat. Deor. I, 5; Acad. Quæst. IV, 3.

tion of interesting discussions, and luminous remarks on the most important topics, e. g. On the Nature of the Divinity; On the Supreme Good; On the Social Duties; On Fate; Divination; the Laws; the Republic, etc. etc.<sup>1</sup>: and have proved a mine of information to succeeding ages, without however betraying any great depth of thought. They are likewise highly valuable as throwing light on the history of philosophy<sup>m</sup>, and have contributed to form the technical language of this science.

### *Epicureans.*

181. The doctrine of Epicurus when first disseminated in their country attracted among the Romans a crowd of partisans<sup>n</sup>, in consequence of its light and accommodating character, and the indulgence it afforded to the inclinations of all<sup>o</sup>; as also because it had the effect of disengaging the mind from superstitious terrors. Unhappily it favoured at the same time a frivolous and trifling spirit. Very few of the Roman Epicureans distinguished themselves by a truly philosophical character; and even these adhered literally to the doctrines of their master, without advancing a step beyond them. Such, among others, was *Lucretius*<sup>p</sup>, who gave a statement of those doctrines in his didactic poem *De Rerum Naturâ*: as a poem, a work of superior merit<sup>q</sup>.

<sup>1</sup> De Div. II, Init.

<sup>n</sup> M. T. Ciceronis Historia Philosophiæ Antiquæ. Ex illius Script. ed. FRIED. GEDIKE, Berl. 1782, 8vo.

<sup>n</sup> Among the most considerable were, Catus and Amafanius; C. Cassius, Tit. Pomponius Atticus, Caius Velleius, Bassus Aufidius; add to these the poet Horace, with several more.

<sup>o</sup> Cic. Fin. I, 7; Tusc. Quæst. IV, 3; Ep. ad Div. XV, 19. SENECA. Ep. 21, 30.

<sup>p</sup> Born 95, died 50 B. C.

<sup>q</sup> C. PLINIUS SECUNDUS, author of the Natural History, who died A. D. 79, by the eruption of Vesuvius, and LUCIAN of Samosata, the satirist (§ 176), who flourished in the second cent. after Christ, (see † J. C. TIEMANN, On the Philosophy and Language of Lucian, Zerbst. 1804, 8vo.), have been numbered among the Epicureans without sufficient grounds: as well as the contemporaries of the latter, Diogenes Laertius (flourished about 211), and Cel-

182. Next to those of Epicurus, the doctrines of the Stoics obtained the greatest success at Rome, especially among men of a severer character\*, who had devoted their lives to public affairs. With such men, the Stoic philosophy being more closely applied to real life, and exercising a marked influence over legislation and the administration of the laws, naturally acquired a more

ext. The latter is known to us as an adversary of Christianity by the work of Origen. By some he is esteemed a Neoplatonist.

\* Such, in the days of the Republic, were the Scipios, and, in particular, the second Scipio Africanus, cf. § 158. C. Lælius; the juriconsult Pub. Rutilius Rufus, Q. Tubero, Q. Mucius Sævola the augur; and subsequently, Cato of Utica, and M. Brutus, the assassin of Cæsar.

\* See the preceding note.

We must here take notice of the sect of the Proculians, founded, in the time of Augustus, by Antistius Labeo, and his disciple Semp. Proculus. This sect was formed in opposition to that of the Sabinians, headed by Masurius Sabinus, a disciple of C. Ateius Capito. See JUST. HENNING. disciple of the Stoic *Q. Sextus* of Chæronea, the grandson of Plutarch. *Seneca*, who appreciated the truth which he discovered in various systems of philosophy but principally attached himself to that of the Portico<sup>d</sup>, was one of the first who drew a distinction between a Scholastic and Practical philosophy. The latter he judged the most essential, its primary object being individual Morality; (*Philosophia Præceptiva*). He gave admirable rules of conduct, after the principles of the Stoics<sup>e</sup>, but betraying at the same time considerable predilection for Exaggeration and Antithesis<sup>f</sup>. *Epictetus* reduced the moral system of the Stoics to a simple formulary, ἀνέχου καὶ ἀπέχου, *sustine et abstine*: and assumed as his leading principle, Freedom.

*Antoninus* imparted to the same system a character of gentleness and benevolence, by making it subordinate to a love of Mankind, allied to Religion. These two last are much less decided advocates of suicide than Seneca (§ 165). About this period a great number of writings of this school proclaimed a more fixed belief in the immortality of the Soul.—Of the *Cynics* the most distinguished during the second century were: *Demonax* of Cyprus, who taught at Athens; *Crescens* of Megalopolis, and *Peregrinus*, surnamed *Proteus*, of Parium in Mysia; who, they say, burnt himself at Olympia about 168 A. C.

The two last contributed nothing to the cause of Science<sup>g</sup>.

### *Peripatetics.*

On each of the Philosophers mentioned in this section, consult Suidas, and the first volume of Patricius, a work cited § 139.

183. The philosophy of Aristotle was not suited to the *practical* character of the Roman mind, and such as devoted themselves to the study of it, became mere commentators of various merit or demerit. We must account *Peripatetics*: *Andronicus* of Rhodes (§ 150), who arranged and expounded at Rome the works of Aristotle<sup>s</sup>; *Cratippus* of Mitylene, whom Cicero the Younger and several other Romans attended at Athens<sup>h</sup>; *Nicolas* of Damascus<sup>i</sup>; *Xenarchus* of Seleucia, who as well as the preceding, gave lessons in the time of Augustus; *Alexander* of Ægæ, one of the preceptors of Nero<sup>k</sup>; *Adrastus* of Aphrodisias<sup>l</sup>; and more especially the celebrated commentator *Alexander* of Aphrodisias<sup>m,\*</sup> the disciple of Herminus and Aristocles, who taught at Alexandria.

<sup>s</sup> Flourished about 80 B. C.

It is thought that he was not really the author of the book *Περὶ πάθων*, ed. HOESCHEL, *Aug. Vind.* 1594; and the Paraphrase of Aristotle's Ethics, ed. DAN. HEINSIUS, *Lugd. B.* 1607, 4to.; 1617, 8vo.; *Cantab.* 1678, 8vo.

<sup>h</sup> Flourished about 48 B. C.

<sup>i</sup> † FRANC. SÉVIN, Inquiry concerning the Life and Works of Nicolas Damascenus, in the Memoirs of the Academy of Inscriptions; and the Fragments of Nicolaus Dam., published by ORELLI, *Lips.* 1804; Suppl. 1811, 8vo. Some critics have attributed to him, without sufficient grounds, the book *Περὶ κόσμου*, found among the works of Aristotle.

<sup>k</sup> To him are attributed the Commentaries on the Meteorologics and Metaphysics of Aristotle, which by others are assigned to Alexander Aphrodisiensis.

<sup>l</sup> Second century after Christ.

<sup>m</sup> At Venice and Florence have been printed, in the sixteenth century, in a separate form, the different Commentaries attributed to him, on the following works of Aristotle:

The Analytica Priora, the Topics, the Elenchi Sophistarum, the books De Sensu et Sensibili, the Physics, with the treatises De Animâ, and De Fato (*Περὶ εἰμαρμένης καὶ τοῦ ἐφ' ἡμῖν*).

Cf. CASIRI Biblioth. Arabico-Hisp., vol. I, p. 243, for the works of Alexander of Aphrodisias.

\* Called, by way of eminence, the Commentator.

He founded a school of commentators,\* which bore his name, and attacked the Stoic doctrine of Fatalism, which he declared irreconcilable with Morality. Among the *Syncretic* Peripatetics, may be mentioned *Ammonius* of Alexandria, who taught at Athens<sup>n</sup>; *Themistius* of Paphlagonia; *Syrianus* and *Simplicius*<sup>o</sup>. (See § 221). The commentaries of the latter, next to those of Alexander of Aphrodisias, are the most distinguished production of these schools.

### *New Pythagoreans.*

184. Pythagoras, whose reputation and even whose philosophy had long been familiar to the Romans<sup>p</sup>; had at the period of which we are treating a large number of followers: his exemplary life, and still more the mysterious character of his history and his doctrines, being the principal causes of the species of enthusiastic reverence with which he was regarded. Some Moral Reformers wished to adopt his principles of practice: of which number were *Qu. Sextius*<sup>q</sup>, (a Roman who wrote in Greek), and *Sotion* of Alexandria<sup>r</sup>; both of them acquainted with Seneca at Rome<sup>s</sup>: and to this class of Pythagoreans it is probable that we should refer *Apollonius* of Tyana, in

\* Surnamed the Alexandrians and Alexandrists. He differed from Aristotle in his doctrine respecting the soul.

<sup>n</sup> In the first century. Plut. de Ex. apud Delph. ed. REISKÆ, tom. vii, p. 512, sqq., et tom. VI, p. 260.

<sup>o</sup> His various commentaries on the works of Aristotle (especially his physical treatises), were published at Venice, at the end of the fifteenth and beginning of the sixteenth centuries.

His Comment. on the Manual of Epict. has been given by SCHWEIGH. Monum. Epict. Phil. tom. IV.

<sup>p</sup> CIC. De Senect., c. 21; Tusc. IV, 2.

<sup>q</sup> Or SEXTUS. He flourished about 2 A. C.

He must not be confounded with Sextus of Chæroneæ (§ 182), the Stoic. His Moral Sentences are to be found in the dubious translation of RUFFINUS, published by TH. GALE, Opusc. Mythol. Phys., etc. p. 645, sqq.

DE BURIGNY, On the Philosophical System of Sextius, in the Memoirs of the Academy of Inscriptions, tom. XXXI.

<sup>r</sup> About 15 A. C.

<sup>s</sup> Seneca, Ep. 108.

Cappadocia<sup>†</sup>, a disciple of *Euxenus* of Heraclea, in Pontus, an imitator of Pythagoras, and a pretender to divination; and finally, *Secundus* of Athens<sup>‡</sup>. Others (for instance, *Anaxilaus* of Larissa, banished from Italy under a suspicion of magical practices<sup>§</sup>), applied the principles of Pythagoras to the study of Nature; or, like *Moderatus* of Gades<sup>¶</sup>, and *Nicomachus* of Gerasa<sup>‡</sup>, endeavoured to discover, in the Pythagorean doctrine of Numbers, a sublime and occult science<sup>‡</sup>, which they blended with the theories of Plato.

### *Neoplatonists.*

See the works mentioned § 200; particularly that of BOUTERWECK.

185. After the downfall of the Sceptic Academy (§ 169, 170), even in the time of Augustus, a new school of Platonists began to form itself, and became popular. Among

<sup>‡</sup> About 120 A. C.

For his Moral Sentences, see SECUNDI ATHENIENSIS RESPONSA AD INTERROGATA HADRIANI, in the work of TH. GALL, referred to above, (note ¶,) p. 633, sqq.

<sup>§</sup> He flourished under Augustus.

<sup>¶</sup> Flourished first century after Christ.

<sup>‡</sup> Second century after Christ.

Nicomachus is said to have been the author of a theory of Numbers (Introductio in Arithmetica, Gr. Paris, 1538, 4to.), explained by JAMBlichus; and of a Manual of Harmony (apud MEIBOM.: ANTIQUÆ MUSICÆ AUCTORES, VII. Amst. 1652, 4to.)

Fragments of his Symbolics of the Science of Numbers (Θεολογούμενα ἀριθμητικά), are to be found in PHOTIUS, Biblioth. Cod. 187, p. 237.

<sup>‡</sup> An Essay on this occult science of Numbers is to be found ap. SEXT. EMPIRIC. adv. Mathem. X, 248. Cf. also PORPHYR. Vit. Pythagor., § 32, sqq.

these *Thrasyllus* of Mendes<sup>b</sup>, the Astrologer, distinguished himself; with *Theon* of Smyrna<sup>c</sup>, the author of an Exposition of Plato<sup>d</sup>; *Alcinous*, who has left us a brief sketch of the Platonic doctrine<sup>e</sup>; *Albinus*, the preceptor of Galen; *Plutarch* of Chæronea<sup>f</sup>, a disciple of Ammonius (§ 83), and preceptor of Adrian; *Calvisius Taurus* of Berytus near Tyre<sup>g</sup>, the master of *Aulus Gellius*; *Luc. Apuleius* of Medaurus in Numidia<sup>h</sup>; and *Maximus Tyrius*, the Rhetorician<sup>i</sup>.

These philosophers made it their object to disseminate in a popular form, the Ethics and Religious Theory of Plato, and constructed for themselves a system of allegorical interpretation, which connected the doctrines of that system with the ancient religious Mysteries<sup>k</sup>. With this they blended much that was derived from the Pythagoreans and Aristotle; and, in the Dogmatic manner, pursued the most lofty speculations (the outline of which had been traced in the treatises of Plato), on the Deity, the Creator, the Soul of the World, the Demons, the Origin of the World, and that of Evil. They supposed our

Ideas to have a substantial existence; and applied their abstract principles to account for phenomena of their own days; for instance, the cessation of oracles<sup>1</sup>. The physician *Galen*<sup>m</sup>, the inventor of the Fourth Figure of Logic, was a calm and sedate Platonist who admitted, to account for the phenomena of Life, the existence of a two-fold Spirit, Πνεῦμα Ζωικόν—Ψυχικόν<sup>n</sup>: *Favorinus* of Arelas, in Gaul, was more inclined to Scepticism<sup>o</sup>. These Platonists were at the same time for the most part *Eclectics*, but not altogether after the manner of *Potamo* of Alexandria<sup>p</sup>, who, while he selected what he judged most tenable from every system, pretended to form of these extracts a separate doctrine of his own; concerning which we have not sufficient details to enable us to judge<sup>q</sup>.

The Neoplatonism of the Alexandrians, as we shall afterwards see, has been improperly deduced from this isolated attempt.

<sup>q</sup> DIOG. LAERT. I, 21.

186. Ænesidemus, a native of Gnossus in Crete, settled at Alexandria<sup>†</sup>, revived, about the commencement of this period, the Scepticism<sup>\*</sup> which had been silenced in the Academy, and wished to make it serve the purpose of strengthening the opinions of Heraclitus to which he was inclined<sup>†</sup>. In conformity with Heraclitus, who lays down that every thing has its contrary, he maintained that we ought to admit universally, that contradictory appearances are presented to each individual<sup>‡</sup>. He placed the Thought under the dominion of external objects, making Truth to consist in the universality of the opinion or perception of the *subject* (Man<sup>†</sup>). He accused the Academicians of being deficient in Generalisation, as Sceptics, and thereby contradicting themselves<sup>¶</sup>. In order therefore to strengthen the cause of Scepticism, he extended its limits to the utmost: admitting and defending the ten Topics (δέκα τρόποι ἐποχῆς), attributed also to Pyrrho (§ 124); to justify a suspense of all positive opinion. These Topics are deduced: 1. From the diversity of Animals; 2. From that of Mankind considered individually; 3. From the fallibility of our Senses; 4.—The circumstances and condition of the Subject; 5.—Position, Distance, and other local accidents; 6.—The combinations and associations under which things present themselves to our notice; 7.—The different dimensions and various properties of things; 8.—Their mutual relations; 9.—The habitude or novelty of the sensations; 10.—The influence of Education, and Institutions, Civil and Religious<sup>‡</sup>. In short,

<sup>†</sup> He probably flourished a little later than Cicero.

<sup>\*</sup> According to the testimony of Aristocles, related by Eusebius, loc. laud. At the same time, Diog. Laert. (IX, 114), mentions among the disciples of Timon (§ 124), a certain *Euphranor* of Seleucia, whose lessons *Eubulus* of Alexandria had followed. To the latter he assigns, as disciple, *Ptolemy* of Cyrene, who, he says, revived Pyrrhonism; and whose disciple *Heraclides*, a sceptical philosopher, had been the master of Ænesidemus.

<sup>¶</sup> Photius.

<sup>‡</sup> *EUSEB.* Præpar. Evang. XIV, 18. *SEXTUS*, Adv. Math. VII, 345; Hypot. I, 36. Cf. *DIOG. LAERT.* IX, 87.

Ænesidemus opposed Sceptical objections to every part of Dogmatical philosophy. According to him, Scepticism (πυρρῶνειας λόγος), is a Criticism exercised with regard to Sensible Phenomena and our Ideas of them; which would convict them all of the greatest inconsistency and confusion<sup>a</sup>.

The fault of this Scepticism is its *End*, and its *pretensions to Universality*.

187. The boldest attack made by any of the ancient philosophers on the possibility of demonstrative knowledge, was that attempted by Ænesidemus against the reality of the Idea of Causality; with the application of his ideas to the investigation of natural causes (*Ætiology*<sup>b</sup>). He argued that the idea of Causality is unfounded because we cannot understand the relations of Cause and Effect: which he endeavoured to prove by arguments *à priori*; and also by insisting on the mistakes and false inferences of the Dogmatists in their inquiries into the nature of Causes.

188. From the time of Ænesidemus to that of Sextus, followed a succession of Sceptics, all of them physicians of the Empiric and Methodic Schools<sup>c</sup>; who confined themselves to the observation of facts, and rejected all theory respecting the causes of diseases. Among these, *Favorinus* (§ 185), attached himself to the principles of Ænesidemus. The most distinguished were *Agrippa*, *Menodotus* of Nicomedia, and *Sextus*. Agrippa<sup>d</sup> reduced the ten *Topics* of Dubitation to five more extensive ones, viz. 1. Difference of Opinions; 2. The necessity that every proof should be itself capable of proof; 3. The Relativeness of our impressions; 4. The disposition to Hypothesis; 5. The fault of arguing in a Circle.

Finally he insisted on this, that there cannot be any certain knowledge, either immediately, ἐξ ἑαυτοῦ, nor me-

diately, ἐξ ἑτέρου; and especially applied himself to criticise the *Formal* part of knowledge<sup>c</sup>.

*Sextus Empiricus.*

Sexti Empirici Opera Gr. et Lat. ed. JO. ALB. FABRICIUS, Lips. 1718, fol. Recens. STRUVE, Regiomont. 1823, 2 vols. 8vo.

*Criticisms on this author :*

GUIL. LANGIUS, De Veritatibus Geometricis adv. Sextum Empiricum, Hafn. 1656, 4to.

De primis Scientiarum Elementis, seu Theologia Naturalis methodo quasi Mathematica digestâ. Accessit ad hæc Sexti Empirici adversus Mathematicos decem Modorum ἐποχῆς seu Dubitationis, secundum editionem FABRICII, quibus scilicet Sextus Scepticorum Coryphæus, veritati omni in os obloqui atque totidem retia tendere haud dubitavit, succincta tum Philosophica tum critica refutatio (per Jac. THOMSON), Regiomont. 1728, (id. 1734), fol.

GOTFR. PLOUCQUET, Diss. examen rationem a Sexto Empirico tam ad propugnandam quam impugnandam Dei existentiam collectarum, Tubing. 1768, 4to.

189. Sextus, surnamed Empiricus, from the School of Physicians to which he belonged, was a native, as appears, of Mitylene<sup>f</sup>, and a pupil of Herodotus of Tarsus<sup>g</sup>, the Sceptic. He put the finishing stroke to the Philosophy of Doubt, about the end of the second century. While he availed himself of the works of his predecessors, especially Ænesidemus, Agrippa, and Menodotus; he contributed much to define the object, end, and method of Scepticism; particularly in his three books Πυρρῶν ἐποχῶν; and to guard against the attacks of the Dogmatists, he made more accurate distinctions between the operation of his system and the practice of the New Academicians or of the Dogmatists themselves.

190. According to Sextus, Scepticism is the faculty (δύναμις), of comparing the perceptions of the senses and

<sup>c</sup> DIOG. LAERT. IX, 88, sqq. SEXTUS, Hypotyp. I, 164—178.

<sup>f</sup> This has been proved by Visconti in his Iconographia, on the testimony of a medal of that city.

<sup>g</sup> DIOG. LAERT. IX, 116.

the conclusions of reason (φαινόμενα τε καὶ νοούμενα), in order by such a competition, so instituted, to arrive (διὰ τὴν ἐν τοῖς ἀντικειμένοις πράγμασι καὶ λόγοις ἰσοσθένειαν), at a suspension of all judgment (ἐποχὴ), on matters the nature of which is obscure to us (ἄδηλον, ἄφανες): hence results a certain repose of the mind (ἀταραξία), and, in the end, a perfect equilibrium (μετριοπαθεία).

His Scepticism admits the existence of perceptions and appearances (φαινόμενα); does not deny the possibility of knowledge but the certainty of it; and abstains from its pursuit. His system is not a Doctrine, but a Manner of contemplating subjects, and consequently does not demand to be proved, but only requires to be stated<sup>b</sup>. His maxim was οὐδὲν μᾶλλον<sup>i</sup>: meaning that no one thing deserves to be preferred to another.

191. Sextus appears sometimes to have forgotten this principle, when he would erect his system into a Doctrine, and represent it as an Art; and an Art destructive of all inquiry after Truth, and denying the possibility of its attainment. He deserves this reproach because: 1. When he finds himself at a loss for arguments of Doubt, he suggests that *hereafter* they may be discovered<sup>k</sup>; 2. He declines all exposition of the real nature of our impressions and knowledge<sup>l</sup>; 3. He entrenches himself, when he finds it necessary, in downright Sophisms<sup>m</sup>; 4. He endeavours, in this manner, by mere sophistical arguments, to prove that no science can be taught or learnt<sup>n</sup>; 5. He goes so far as to argue, in opposition to his own doctrine (§ 190), against the reality of our perceptions<sup>o</sup>; 6. He does not define with sufficient perspicuity the facts which he assumes as data, e. g. our impressions, and the laws of Thought.

<sup>b</sup> Sextus, Hypotyp. I, 1. 4. 25.

<sup>i</sup> Ibid, 14.

<sup>k</sup> Ibid. 33, sqq.; II, 259.

<sup>l</sup> Idem, I, 9, sqq.

<sup>m</sup> Adv. Math. I, 9.

<sup>n</sup> Ibid.

<sup>o</sup> Ibid. 351, sqq.

192. Notwithstanding these objections, his statement of Scepticism is a very important work, both in respect of the manner in which he has treated it, and as a record of the state of Science, more especially of Metaphysical Philosophy, among the ancients. In the five last books of his treatises, Πρὸς τοὺς μαθηματικούς, he reviews the doctrines of the principal philosophers on the most important subjects; setting in a strong light the incertitude of their Principles, and contradictory or inconsistent conclusions. He endeavours to show that the Dogmatists had never discovered any solid and irrefragable *criterium* of Truth: and that they all disagree with respect to the Principles of Logic, Physics, and Ethics. Denying the existence of any self-apparent Certainty (in consequence of the contradictions which prevail in the theses of Philosophers), he begins by demanding that every truth should be proved; and then goes on to show that such proof is impossible, for want of self-evident Data. Beginning with such principles he proceeds to demolish all the Scientific labours of the human understanding; not excepting the Mathematics.

193. Such a system of Scepticism had the tendency to cut short all farther research, and appeared to threaten Science itself with extinction. Nevertheless, such a Scepticism contained in itself its own contradiction: pretending to restrain the natural tendency of the human understanding to these inquiries, without being able to make good the object it promised to realise, the repose of the mind. At the time when it appeared it seems to have made little impression; in consequence of the slight interest then felt for philosophical studies; and it died with *Saturninus* (also called Cythenas), a disciple of Sextus<sup>p</sup>. The only persons who paid attention to it were some physicians, such as Galen, (*De optimo docendi genere*<sup>q</sup>), and the philosopher Plotinus<sup>r</sup>. The latter<sup>s</sup> opposed to it a Dogmatism allied to the Supernatural and Enthusiastic.

<sup>s</sup> PLOT. ENN. V, lib. V, 11.

*Philosophic Doctrines of the Jews and Gnostics.*

194. It has not been perfectly ascertained whether at this period there existed an Eastern School of Philosophy, 'Ανατολική διδασκαλία'. It has been asserted by Mosheim, Brucker<sup>u</sup>, Walch<sup>x</sup>, and Buhle; and denied by Meiners<sup>y</sup> and Tiedemann<sup>z</sup>. It is impossible to controvert the existence of certain opinions peculiar to the East; but the question is, whether they had already assumed a philosophical form and character, or whether they were not rather developed and brought to perfection in proportion to the progress which Grecian philosophy, and particularly that of Plato, made among the Orientals<sup>a</sup>. This last conjecture becomes still more probable when we reflect that at this period appeared the apocryphal writings, falsely ascribed to Zoroaster, Hermes, and others; as well as when we remark the efforts made by several Gnostics<sup>b</sup>, to depreciate the works of Plato<sup>c</sup>.

195. On the supposition that the Orientals had a philosophy of their own, it is natural to suppose that the immense extent of the Roman Empire would bring it into contact with that of the Western Nations, and contribute to their admixture. History has afforded us proof of

<sup>a</sup> BOUTERWECK, in an excellent treatise, which we shall have occasion to notice § 200, considers the mystical doctrines of immediate Intuition, and the Emanation of Spirits, as having been derived from the East and from Persia; particularly through the channel of Alexandria; where they had already been long established.

<sup>b</sup> PLOTIN. Enn. I, lib. IX, 6.

<sup>c</sup> See BUHLE, Compendium of the History of Philosophy (§ 37), part IV, p. 73, sqq: and the larger work of TENNEMANN on the History of Philosophy (ibid.) tom. VI, p. 438.

this in the doctrines of the Jews, the Gnostics, and the Neoplatonists. Alexandria, where, from the time of the Ptolemies, every system of philosophy had been taught, was the principal point of union between the Eastern and Western doctrines.

### I. *Jews.*

See the works mentioned in § 73.

196. During their exile the Jews had collected many opinions belonging to the religion and philosophy of Zoroaster (§ 70), for example, that of a Primitive Light, of Two principles, the Good and the Evil, and of the Demons. Subsequently, a certain number of their countrymen who had settled in Egypt, and, in consequence of their medical studies had engaged in speculation (particularly those who were devoted to a contemplative life, and therefore called Therapeutæ), acquired some knowledge of Grecian philosophy<sup>d</sup>: but the discoveries which they found there they regarded as derived from their own religion. In order to substantiate this idea, Aristæas<sup>e</sup> devised the story of an ancient translation into Greek of the Old Testament; and *Aristobulus*<sup>f</sup>, a Peripatetic, forged certain Apocryphal books and passages.

### *Philo of Alexandria.*

197. The Jew Philo<sup>s</sup>, a man of a cultivated mind, settled at Alexandria, brought forward in a better shape the same opinions. He applied his knowledge of the systems of the Greeks, and, in particular that of Plato, (who has so many points of correspondence with the Orientalists), to the setting forth in a more complete manner (as he fancied), the religion of his country. *Josephus*<sup>b</sup> subsequently followed the same course. On the other hand Philo transferred into his system of Platonic philosophy many of the opinions of the East, in return for those which he borrowed from Plato. He may be considered (as *Bouterweck* has ranked him), as the *first Neoplatonist of Alexandria*. He assumes that the Divinity and Matter, are the two first principles; existing from eternity. Agreeably to the opinions of Plato, he characterises them thus: the Divinity as a Being, Real, Infinite, and Immutable; Incomprehensible to any human understanding (ὄν): Matter, as non-existing, (μὴ ὄν); but having received from the Divinity a form and life. He represents the Deity, by certain Oriental figures, as the Primitive Light, as an Infinite Intelligence; from whom are derived, by irradiation, all finite Intelligences. In the soul of the Divinity are concentrated the ideas of all things possible. This λόγος of the Divine Being, the focus of all Ideas (λόγος ἐνδιάθετος), is in fact the Ideal World; and called also the Son of God, or the Archangel. He is the image of God, the type after which God by his creative power (λόγος προφορικός), formed the world, such as it presented to our senses. We cannot become ac-

<sup>s</sup> Born at Alexandria, some years B. C.

<sup>b</sup> Flavius Josephus, born at Jerusalem, 37 A. C.

quainted with the nature of God but by His immediate influence on our minds: hence the doctrine of internal Intuition<sup>1</sup>. We may clearly observe how, in the writings of Philo, the doctrines of the Jews were modified by those of Platonism; and how this admixture gave birth to new opinions. *Numenius* of Apamea in Syria<sup>k</sup>, in part admitted these innovations, and maintained that reason is the faculty of acquiring a knowledge of that which is Absolute, and of whatever lies beyond the limits of sense. He distinguished in the nature of the Divine Being, whom he also maintained to be incorporeal (ἀσώματος), the Supreme Divinity and Pre-existent; an Immutable, Eternal, and Perfect Intelligence: and the Creator of the world or Demiurgos, (νοῦς); having a twofold relation: to the Divinity as His Son, and to the World, as its author. The same philosopher maintained the Immateriality and Immortality of the Soul, and styled Plato the Attic Moses, (ἀττικὸς Μωϋσῆς<sup>l</sup>).

198. *Cabbala* (that is *oral* tradition) is a system of pretended illumination, diversified by a variety of fables, which the Jews affect to have received from a Divine source through secret tradition. To treat of it only as far as it belongs to the history of philosophy—it had its origin as early as the first centuries of the Christian era, and was invented or systematised by the Rabbi *Akibha*<sup>m</sup>, and his disciple *Simeon Ben Jochai, the spark of Moses*. It consists in a string of philosophical legends, which represent all things as descending in a continued scale, from the First Light; the Deity and Creator. They are arranged in ten Sephiroths or luminous circles; and four worlds, *Azyluth, Briah, Jezirah, and Aziah*. Adam Cadmon, the first man, was the firstborn of the Divinity, the Messiah, by whose means the rest of the universe emanated from the Almighty, who, nevertheless, continues to maintain and uphold the same: God being the inherent cause of all things. All things that exist are of a *spiritual* nature, and matter, is nothing but a condensation or attenuation of the rays of light; forming, as it were, the *embers* of the Divine essence. In a word every substance partakes of the Divine nature.

To this theory of *Emanation* were added a tissue of imaginations respecting the Demons, which involved a belief in magic: respecting the four elements of souls;

<sup>m</sup> Died A. D. 138.

their origin and formation; and lastly with regard to man considered as a microcosm, or little world in himself. This last notion gave occasion to a new fancy, that of pretending to acquire knowledge by ecstasy. The whole is a mass of strange and exaggerated fictions, conceived under the influence of the religion of the Persians, but employed by those who advanced them to recommend to general notice the sacred history and doctrines of the Jews; especially with respect to the creation, and the origin of evil. It is probable that the Cabbalistic books *Jezirah* and *Sohar* (see the works mentioned at the head of this §), the first attributed to the Rabbi Akibha, the second to Simeon Ben Jochai, have been from time to time interpolated by their expositors. The Christians became acquainted with the Cabbala, by *name*, only in the fifteenth century; the Jews having carefully concealed from them these mysteries.

## II. *Gnostics.*

WALCH, *De Philosoph. Oriental. Gnosticorum Systematis fonte; and MICHAELIS de Indiciis Gnosticæ Philosophiæ tempore LXX Interpretum et Philonis; second part of his last Syntagm. Commentt.*

† J. AUG. NEANDER, *Origin and Development of the principal Gnostic Systems, Berlin, 1818, 8vo.*

The same author had previously published: *De Fidei Gnoseosque ideâ et eâ, quâ ad se invicem et ad Philosophiam referuntur ratione secundum mentem Clem. Alexandrini, Heidelb. 1811, 8vo.*

199. The same spirit of extravagant speculation possessed the Gnostics also. They pretended to a superior and mysterious knowledge (*γνῶσις*) of the Divine Being, and the origin of the World: blending the religious dogmata of the Persians and Chaldees with those of the Greeks and Christians. The greater number of them professed Christianity, though they were looked upon as heretics: Some attached themselves to the

Jewish persuasion; others became its adversaries; others again appear to have belonged to no particular religious creed whatsoever. The most distinguished among them, (for the most part Orientals), were *Simon Magus*, *Menander* the Samaritan, *Cerintus* the Jew, all belonging to the first century: then *Saturninus* the Syrian, *Basilides*, *Carpocrates*, and *Valentinus* of Alexandria, who approximated the Neoplatonists, (second century): *Marcion* of Sinope<sup>n</sup>, *Cerdon* and *Bardisanes*, both Syrians<sup>o</sup>, (about the middle of the second century); and *Manes*<sup>p</sup> a Persian, (put to death by Sapor A. D. 277). Their followers subsisted some ages after. One division of them recognised in the Divinity the One Great principle whence they derived all things, according to different degrees or classes of spirits called *Æons*; another admitted the existence of Two first principles, a Good and an Evil one, continually opposed to, and conflicting with each other. Lastly, a third division of Gnostics maintaining the existence of two Principles (of Light and Darkness), asserted that they were both derived from one common Creator. In general, they identified matter with the Evil principle, and regarded even the formation of the Universe as a fall and declension from the Divine Being. These their leading dogmata were associated with a multitude of fictions incredibly daring and extravagant: and each of which supposed a particular revelation imparted to their authors. The imagination has been allowed among the Orientals a predominant influence, and they delight in losing themselves in a labyrinth of hypotheses allied to the supernatural. Morality could not but suffer in consequence of such extravagancies, and was apt to sink into a narrow asceticism.

200. Neoplatonism had its origin in the frequented school of the Platonists of Alexandria, and was characterised by an ardent and enthusiastic zeal. Its disciples aspired to attain the highest pinnacles of science, to acquire a knowledge of the *absolute*, and an intimate union (*ένωσις*) there-

with, as the final end of man's being. The way thereto they held to be contemplation, (*θεωρία*).

201. The principal causes which led to this new system were: The decline of genuine Grecian philosophy, and the admixture with its remains of the theories of the East; added to a continually-increasing attachment to Oriental exaggeration and enthusiasm, which they confirmed by frequent appeals to celestial revelations, while they depreciated the merit of Plato as a philosopher<sup>9</sup>. The prevailing spirit of the age, and the decline of the Roman empire contributed to this. To these may be added two other causes: the opposition the Sceptics of the modern school continually made to all pretensions to rational knowledge; and the alarm which the victorious progress of Christianity occasioned to the defenders of the old religion, lest it should be utterly overthrown.

The importance which Platonism assumed in this conflict between the Christians and the Polytheists, added to the daily increasing influence of Oriental notions, caused that philosophy to assume a fresh distinction: its ardent character being aided by the scientific turn of the Greeks, and heightened by the admixture of many other doctrines.

202. Philo of Alexandria (§ 197), Numenius (*ibid.*) and Atticus, had already given specimens of this sort of mystical speculation, and association of Oriental ideas with those of the Platonists. The same is observable in the writings of many of the Greek Fathers of the Church, Justin, for instance, Clement of Alexandria, and Origen; who not unfrequently *Platonise*. *Ammonius* of Alexandria, a man of low birth, obliged to gain his livelihood as a porter (whence his surname of *Saccas*), and probably also an apostate from Christianity<sup>r</sup>, but endowed with a strong love of knowledge, great talents, and an enthusiastic temper, threw himself into this new career of philosophy,

<sup>9</sup> PLOTIN. *Enn.* II, lib. IX, 6.

<sup>r</sup> EUSEB. *Hist. Eccles.* VI, 19.

and became the founder of a school<sup>a</sup>, which laboured to reconcile the doctrines of Plato and Aristotle on the most important topics<sup>b</sup>. He infused the same enthusiastic spirit into his disciples, among whom *Longinus*<sup>c</sup>, a celebrated critic and judicious thinker<sup>x</sup>, *Plotinus*, *Origen*, and *Herennius*, were the most distinguished. The three last made a solemn engagement to keep their doctrines secret<sup>y</sup>.

and vigorous imagination. He early manifested these abilities in the school of Ammonius at Alexandria. Subsequently he determined to accompany the army of Gordian to the East, in order to study the Oriental systems in their native soil. He returned a dreamer, perpetually occupied with profound but extravagant meditations; labouring to attain the comprehension of the Absolute by contemplation; a notion borrowed from Plato, which became exaggerated in his hands. Carried away by his enthusiasm he thought that he was developing the designs of the philosopher of the Academy, when in fact he exhibited his thoughts only partially and incompletely. The impetuous vivacity of his temper, which caused him perpetually to fall into extravagancies, prevented his reducing his mystical Rationalism to a system. His various scattered treatises were collected by Porphyry in six *Enneades*<sup>a</sup>.

He died in Campania, A.D. 270; having taught at Rome, and excited the almost superstitious veneration of his disciples.

204. Plotinus\* assumes, as his principle, that philosophy can have no place except in proportion as knowledge and the thing known,—the *Subjective* and the *Objective*—are identified. The employment of philosophy is to acquire a knowledge of the Unity, (τὸ ὅν, τὸ εἶν, τὸ ἀγαθόν), the essence and first principle of all things: and that not mediately by thought or meditation, but by a more exalted method, by direct intuition (καρπουσία), anticipating the progress of reflection<sup>b</sup>. The end of his philosophy according to Porphyry (§ 215), is an immediate union with the Divine Being<sup>c</sup>. He was led by twofold considerations, Scientific

<sup>c</sup> Enn. V, lib. I, 1, 2.

as well as Moral, to this mystical sort of Idealism: the only path which human Reason had not yet essayed.

205. Every thing that exists, exists by the law of Unity; is one; and partakes in Unity. Nevertheless External Nature and Unity are not identical; because every object comprises a plurality of others. Neither is reason Unity; for it contemplates Unity in a complete manner, not *without* but *within* itself. It is at once the subject contemplating and the object contemplated: therefore it is not single but twofold; it is not the first or Primitive Being, but only Unity deduced and derived from some other principle. Primitive Unity is not one thing, but the principle of all things; absolute good and perfection; absolute in itself, and incomprehensible. It has neither quantity nor quality; neither reason nor soul: it exists neither in motion nor repose; neither in space nor time; it is not a numeric unity nor a point, for these are comprehended in other things, in those namely which are divisible; but it is pure Existence without Accident; of which we may form a notion by conceiving it to be sufficient to itself: it is exempt from all want or dependency, as well as from all thought or will: it is not a thinking Being, but Thought itself in action: it is the principle and cause of all things, infinitely small, and at the same time of infinite power; the common centre of all things,—*Good*<sup>d</sup>—*The Deity*.

See the work of OELRICH, § 200, and:

GOTTL. WILL. GERLACH, Disputatio de Differentiâ, quæ inter Plotini et Schellingii Doctrinam de Numine Summo intercedit, Viteb. 1811, 4to.

206. Unity is also represented as Primitive and Pure Light, from which perpetually radiates a luminous circle pervading all space. It imparts the sight and knowledge of itself, and at the same time (without losing its

<sup>d</sup> Enn. VI, lib. IX, 1, sqq.

Unity), it is the essence of all things that exist<sup>e</sup>. The *One* and the *Perfect* continually overflows, and from it Being, Reason, and Life, are perpetually derived, without deducting any thing from its substance, inasmuch as it is simple in its nature, and not, like matter, compound<sup>f</sup>. This derivation of all things from Unity, does not resemble Creation which has reference to time, but takes place purely in conformity with the principles of causality and order, without volition; because to will is to change<sup>g</sup>. From this primordial Unity there emanates, in the first place (as light does from the sun), an eternal essence of the most perfect nature; viz. Pure Intelligence, (νοῦς), which contemplates Unity, and requires only *that* for its existence. From this in its turn emanates the Soul of the world, (ψυχὴ τοῦ παντός or τῶν ὅλων).

Such are the three elements of all real existence: which themselves have their origin in Unity<sup>h</sup>: this has been (somewhat *impiously*) called the Trinity (*Trias*) of Plotinus<sup>i</sup>.

207. Pure Intelligence (Νοῦς), is the efflux and the image of Unity; but inasmuch as it contemplates Unity as its object, it becomes itself a subject, and is thus distinguished from that which it contemplates; hence the first instance of Duality. Inasmuch as Intelligence contemplates in Unity that which *is possible*, the latter acquires the character of something determined and limited; and so becomes the *Actual* and *Real* (ᾧν). Consequently, Intelligence is the primal reality, the base of all the rest, and inseparably united to real Being. The object contemplated and the thinking subject, are identical; and that which Intelligence thinks, it at the same

<sup>e</sup> Enn. III, lib. VIII, 8, 9; Enn. VI, lib. VIII, 16; Enn. IV, lib. III, 17; Enn. V, lib. I, 7.

<sup>f</sup> Idem, VI, lib. IX, 9.

<sup>g</sup> Idem, V, lib. I, 6.

<sup>h</sup> Idem, II, lib. IX, 1. III; lib. V, 3, V; lib. I, 3 et 6; lib. II, 1.

<sup>i</sup> JOH. HEIM. FEUSTKING, De Tribus Hypostasibus Plotini, Viteb. 1694, 4to. Cf. Dissertations of ROTH and JANUS, quoted § 200.

time *creates*. By always thinking, and always in the same manner, yet continually with some new difference, it produces all things: it is the essence of all imperishable *essences*: the sum total of infinite life <sup>k</sup>.

208. The Soul (i. e. the *Soul of the World*), is the offspring of Intelligence, and the thought (λογος) of Intelligence, being itself also productive and creative. It is therefore Intelligence, but with a more obscure vision and less perfect knowledge; inasmuch as it does not itself directly contemplate objects, but through the medium of Intelligence; being endowed with an energetic force which carries its perceptions beyond itself. It is not an original but reflected light, the principle of action, and of external Nature. Its proper activity consists in contemplation (θεωρία); and in the production of objects by means of this contemplation. In this manner it produces, in its turn, different classes of souls, and among others the human; the faculties of which have a tendency to elevation or debasement. The energy of the lowest order, creative, and connected with matter, is Nature (φύσις<sup>l</sup>).

209. Nature is a contemplative and creative energy, which gives form to matter (λογος ποιῶν); for form (εἶδος—μορφή); and thought (λογος); are one and the same. All that takes place in the world around us is the work of contemplation<sup>m</sup>. Thus from Unity, as from the centre of a circle, are progressively derived Plurality, Divisible Being, and Life; by continued abstraction. In Unity, form and matter are distinguishable; for it is Form that fashions; which supposes something capable of receiving a determinate impression<sup>n</sup>.

210. Form and Matter, Soul and Body, are inseparable.

<sup>k</sup> Enn. VI, lib. VIII, 16; Enn. IV, lib. III, 17; Enn. VI, lib. VII, 59; lib. VIII, 16; Enn. V, lib. I, 4, 7; lib. III, 5, 7; lib. V, 2; lib. IX, 5; Enn. VI, lib. VII, 12, 13.

<sup>l</sup> Enn. V, lib. I, 6, 7; lib. VI, 4; Enn. VI, lib. II, 22.

<sup>m</sup> Enn. III, lib. VIII.

<sup>n</sup> Enn. II, lib. IV, 14; Enn. III, lib. VI, 7.

There never was a time when the universe was not animated; but as we can *conceive* it not to have been so, the question suggests itself: *What is matter; and how was it produced by Unity* (since the latter is the principle of all Reality?) Matter is real, but devoid of Form; it is indeterminate, capable of receiving a form, and stands in the same relation to it as shade to light. Unity, as being the cause of Reality, continually progresses from itself as a centre: and following this progressive scale of production to the end, we arrive at a final product, beyond which no other is possible; an ultimate term whence nothing can proceed, and which ceases to retain any portion of unity or perfection. The Soul, by its progressive contemplation, which is at the same time *production* also, creates for itself the scene of its action; that is, Space, and therewith *Time* also. The Soul is a light kindled by Intelligence, and shedding its rays within certain limits, beyond which is night and darkness. It contemplates this darkness, and gives it a form, from its own incapability of enduring any thing unimpressed by Thought; and thus out of darkness it creates for itself a beautiful and diversified habitation, inseparable from the cause which produced it; in other words it bestows on itself a body<sup>o</sup>.

Plotinus appears sometimes to regard unformed or rude matter as a product of the mind, but through an imperfection in its operations: supposing the mind while occupied in creation to have been sometimes carried out of itself, without fixing its view on the First and Perfect Principle; and consequently becoming liable to indeterminateness<sup>p</sup>. At other times he speaks of unformed matter as possessed of reality, but *not* derived from the Soul<sup>q</sup>.

211. There is an Intellectual as well as a Sensible World: the latter is but the image of the former, and

<sup>o</sup> Enn. I, lib. VIII, 7; Enn. III, lib. IV, 9; Enn. II, lib. III, IV.

<sup>p</sup> Enn. I, lib. VIII, 3, 4.

<sup>q</sup> Enn. III, lib. VIII, 1.

hence their perfect accordance. The intellectual world is a Whole, Invariable, Absolute, Living; undivided in point of Space; unchangeable through time: it is Unity in Plurality and Plurality in Unity.\* Indeterminateness exists even in the Intellectual world: the greater the distance from True Being the greater the degree of Indeterminateness.

In the Sensible World, (the reflection of the former), are plants, the earth, rocks, fire, etc.—all of them endowed with life; for the World itself is an animated Idea. Fire, air, and water are ideas endowed with life: a Soul inhabiting Matter, as a creative principle.

Nothing in Nature is devoid of *Reason*: even the inferior animals possess it, but in a different degree from man†.

212. Every object possesses Unity and Multiplicity. To the Body belongs Multiplicity, divisible with reference to Space. The Soul is an essence devoid of extent, immaterial, and simple in its nature; without body; or with a body which has two natures, the superior one indivisible: the inferior divisible. (Descent of Souls from the Intellectual to the Sensible world).

Plotinus states very ably the metaphysical arguments for the immateriality and immortality of the Soul: but at the same time gives loose to an extravagant imagination in his dreams respecting the reunion of the immaterial element with the corporeal substance‡.

213. Every thing that takes place is the result of Necessity, and of a principle identified with all its consequences; (in this we see the rudiments of Spinozism, and the Theodicée of Leibnitz§). All things are connected

\* [The reader will be obliged to me for occasionally omitting small portions of this statement (as I have done elsewhere), which are too abrupt and concise to be intelligible to any one but those who may have just read the original author, and therefore have no occasion to consult the present work. *Trans.*]

† Enn. IV, lib. IV, VIII, IX; Enn. VI, lib. IV, VII.

§ Enn. VI, lib. VII, 8—10; Enn. IV, lib. IV, 4, 5; Enn. VII, lib. II, 3.

together by a perpetual dependency; (a system of universal Determinism, from which there is only one exception, and that rather apparent than real, of *Unity*). Out of this concatenation of things arise the principles of natural Magic and Divination<sup>u</sup>. As for the existence of Evil in the external world, Plotinus considers it to be sometimes an unavoidable negation of good, at others, something positive; such as Matter, Body; and, in this latter particular, sometimes as being superadded to the soul, and the cause of imperfection in its productions; sometimes as seated within the soul, as its imperfect product. In this manner he falls into the very fault which he urges against the Gnostics<sup>v</sup>. He is also led to adopt a system of Optimism and Fatalism, adverse to Morality<sup>y</sup>; though occasionally he admits that moral Evil is voluntary, and the author of it accountable<sup>z</sup>.

214. Unity (the Divinity), being Perfection itself, is the end and object of all things, which derive from him their nature and their being; and which cannot become perfect but through him. The Human Soul cannot attain perfection or felicity but by the contemplation of the Supreme Unity, by means of an absolute abstraction (*ἀπλῶσις*, Simplification), from all compounded things, and by ascending to the heights of pure existence. In this consists Virtue, which is twofold: Inferior Virtue, (or *πολιτική*), belonging to such souls as are in the progress of purification; and Superior Virtue, which consists in an intimate union, by contemplation, with the Divine Being (*ἔνωσις*). Its source is the Divinity himself. The Soul acquires by its contemplation of Divine beauty a similar grace; and derives warmth from the Celestial fire<sup>a</sup>.

215. This system is built on two principles unsup-

<sup>u</sup> Enn. III, lib. II, 16; Enn. IV, lib. IV, 32. 40.

<sup>v</sup> Enn. I, lib. VIII; Enn. II, lib. IX; Enn. III, lib. II.

ported by proof. These are: 1st. That the Absolute and Universal, which is inaccessible to the senses, is the Principle of the Universe, and may be recognised as such: 2dly. That it can be comprehended by means of an intellectual contemplation, superior in its nature to Thought itself. Plotinus represents Thought as Contemplation—transforms Philosophy into Poetry—and our conceptions into substantial objects. His doctrine is a perversion of some Platonic notions carried to extravagance by the enthusiasm prevalent in that age. Neglecting the humble question of *possibilities*, his philosophy pretends to supply at once a complete theory of universal knowledge. At the same time it certainly contains several valuable hints respecting our faculties for acquiring knowledge, and some elevated thoughts, which have been borrowed and improved by other philosophers. It acquired the highest popularity, principally because it derived knowledge from a source superior to the senses; and owing to its doctrine of a *Triad*, and the relation it supposes between it and the external world: and in short was considered a complete exposition of the theory of the Great Plato: of that Plato whom men began now to consider divinely inspired<sup>b</sup>. Next came the attempt to prove the correspondence of Plato's system with those anterior doctrines whence he was supposed to have derived so many of his own: viz. of Pythagoras, Orpheus, Zoroaster, and Hermes; and they were not long without apocryphal books also, attributed to the same, to substantiate this notion. They went farther, and desired to prove a like correspondence between Plato and his successors, particularly Aristotle. All these attempts, which were inconsistent with a truly philosophical spirit, did but foster the prevailing taste of the age for superstition and mystical exaggeration. (Magic and Divination, etc.).

Among the numerous disciples of Plotinus were principally distinguished *Porphyry* (whose proper name was *Malchus*), and *Amelius* or *Gentilianus* of Etruria. The

<sup>b</sup> Procli Theol. Platonis, lib. I, c. 1.

works of the latter, illustrative of the theory of Plotinus, have not come down to us.

### § 216.

Porphyrîi Liber de Vitâ Pythagoræ, ejusdem sententiæ ad intelligibilia ducentes, cum Dissertatione de Vitâ et Scriptis Porphyrîi, ed. LUCAS HOLSTENIUS, *Rom.* 1630, 8vo. Cf. § 88.

*Malchus* or *Porphyry* was born A. D. 233, at Batanea, a colony of the Tyrians in Syria, and after having been formed by the instructions of Origen and Longinus, whom he attended at Athens (§ 202), he went to Rome at the age of thirty, and there frequented the school of Plotinus, of whom he became a passionate admirer, and subsequently the biographer (§ 203). He possessed much more knowledge than his master, but less depth of understanding; coupled with considerable vanity and love of distinction. To judge from his writings, he possessed an inquisitive and critical spirit, and did not scruple to express doubts respecting some particulars of the Pagan mythology, the belief in apparitions, for instance, and demons<sup>c</sup>; but on the other hand he was at times carried away by mystical and extravagant notions. He appears to have been so particularly in his latter days; when, like Plotinus, he pretended to have been honoured by a divine vision<sup>d</sup>. His labours were principally devoted to the explanation and diffusion of the philosophy of his

<sup>c</sup> See his Epistle to Anebo.

<sup>d</sup> Porphy. Vita Plot. sub fin.

master; to an attempt to blend the theory of Aristotle with those of Plato and Pythagoras; to the elucidation of certain topics connected with his religion, such as those of sacrifice, divination, the demons, and oracles; and lastly, to attacks on Christianity, against which he composed certain works\*, while resident in Sicily. He taught eloquence and philosophy at Rome, after the death of Plotinus, and died A. D. 304.

### *Iamblichus.*

Iamblichus de Mysteriis Ægyptiorum liber seu Responsio ad Porphyrii Epistolam ad Anebonem, Gr. et Lat. ed. THOM. GALE, *Oxon.* 1678, folio; with the other works of Iamblichus.

EjUSD.: Περὶ βίου Πυθαγορικοῦ λόγος. See § 88: (with)

EjUSD.: Λόγος προτρεπτικὸς εἰς φιλοσοφίαν, adhortatio ad Philos. Textum, etc., recensuit, interpretatione Latina, etc., et Animadversionibus instruxit THEOPH. KIESSLING, *Lips.* 1813, 8vo.

EjUSD.: De Generali Mathematicum Scientia (the original in the *Anecdota Græca* of VILLOISON, tom. II, p. 188, sqq.), and Introductio in Nicomachi Geraseni (see § 184) Arithmeticam, ed. SAM. TENNULIUS, *Arnh.* 1668, 4to, et Theologumena Arithmetices, *Paris.* 1543, 4to.

GE. E. HEBENSTREIT, Diss. de Iamblichi Philosophi Syri doctrina, Christianæ Religioni quam imitari studet, noxia, *Lips.* 1704, 4to.

217. The mystical philosophy of Iamblichus was even still better adapted to the temper of the age. He was born at Chalcis in Cœle-Syria, became the disciple of a certain Anatolius and of Porphyry: obtained the surname of Θαυμάσιος and Θεϊότατος, and died A. D. 333. In reputation he soon surpassed his master, Porphyry; but not in talent. In his life of Pythagoras he appears as a Syncretist, or compiler and combiner of different systems, but without critical talent. In the fragments of his work on the soul, and in his letters†, we discover some good sense, and more acquaintance with his opinions of the old philosophers,

\* EUSEB. VI, 19, Hist. Eccles.

† Preserved to us by Stobæus.

with which he is apt to blend his own philosophical tenets. It is very doubtful<sup>s</sup> whether he was the author of the work on the mysteries of the Egyptians, but if so, no one ever carried to a greater length than he did, the mysticism and extravagance of his age. Styling himself the priest of the Divinity, he there, with the most perfect assurance, gives solutions of the queries proposed by Porphyry in his letter to Anebon (§ 216): and defines with the utmost minuteness the different classes of angels, the apparitions of gods and demons; with a multitude of details equally authentic. He maintained the doctrine of union with God (δραστική ένωσις), by means of theology and theurgy, or the supernatural science; to which he made philosophy subordinate.

By Theurgy he meant to express the practice of certain mysterious actions, supposed to be acceptable to the Divinity; and the influence of certain incommunicable symbols, the perfect knowledge of which belongs to God alone, whereby the Divinities are influenced according to our wishes: and to give some colour to these extravagances he referred to the Hermetical books, whence he chose to suppose that Pythagoras and Plato had derived their theories.

*Successors of Iamblichus and their contemporaries.*

218. *Iamblichus* had a great number of followers; among others *Dexippus*, *Sopater* of Apamea, *Ædesius*, the successor of Iamblichus, and *Eustathius* the successor of the latter, both of Cappadocia. Among the disciples of *Ædesius* were *Eusebius* of Myndus, and *Priscus* of Molossis, both of whom rejected the belief in Magic and Theurgy<sup>h</sup>, to which *Maximus*<sup>i</sup> of Ephesus and *Chrysanthius* of Sardes were inclined. To the school of the latter be-

† DE BURIGNY, Life of the Philosopher Proclus, and Notice of a MS. containing some of his works hitherto unpublished: in the Memoirs of the Academy of Inscriptions, tom. XXXI.

219. This philosophy was reinforced by the accession of Proclus, surnamed Διάδοχος, and born at Constantinople A. D. 412. He spent his ardent and enthusiastic youth at Xanthus\*, a city devoted to Apollo and Minerva, where his parents resided. Thence he removed to Alexandria, where Olympiodorus was teaching; and subsequently to Athens, where the lessons of Plutarch, of Asclepigenia his daughter, and his successor Syrianus† (§ 218), instructed him in the philosophy of Aristotle and Plato. When on his travels he procured himself to be initiated in all the mysteries and arcana of Theurgy. He united an imaginative temper to great learning, but was unable to balance his acquirements by any weight of un-

\* In Lycia, hence he was called *Lycius*.

† Proclus succeeded the latter in his school of Platonism—whence his name Διάδοχος.

derstanding. He looked upon the Orphic poems and Chaldaean oracles, which he had diligently studied as divine revelations (§ 71), and capable of becoming instrumental to philosophy by means of an allegorical exposition; whereby also he endeavoured to make Plato and Aristotle agree<sup>u</sup>. He called himself the last link of the Hermaic chain (σειρὰ ἑρμαϊκή), that is, the last of men consecrated by Hermes, in whom, by perpetual tradition, was preserved the occult knowledge of the Mysteries<sup>x</sup>. He elevated faith (πίστις), above Science, as forming a closer bond of union with Good and *Unity*<sup>y</sup>.

220. His sketch of philosophy contains a commentary on the doctrines of Plotinus, and an attempt to establish this point, that there is but one real cause and principle of all things, and that this principle is Unity, which produces all things in one uniform order, by triads. His obscure system was founded on an imperfect analysis and synthesis of the properties of Being, of which it admitted three grand divisions, Existence, Life, and Reason, or *Noûs*. All these he derived from Unity, and made them the sources of three other triads (Enned).

He distinguished the Divinities, (making these also descend from Unity and give birth to triads), into Intelligible and Intelligent, Supernatural and Natural: attributed a Supernatural efficacy to the *name* of the Supreme Being, and, like his predecessors, exalted Theurgy above Philosophy<sup>z</sup>. Proclus also attacked the Christian religion; being principally offended by the doctrine of the creation of the world<sup>a</sup>. In his three treatises on Providence, Fate, and Evil<sup>b</sup>, he states with great ability his notion that

the latter does not spring from *Matter*, but from the limitation of Power, and labours to reconcile the system of Plotinus with the conclusions of sound reason.

221. Proclus died A. D. 485, with a reputation for wisdom and even for miraculous powers approaching adoration; leaving behind him a crowd of followers, of whom some were females, such as *Hypatia*<sup>c</sup>, *Sosipatra*, *Asclepigenia*, etc. His disciples were of very different degrees of talent, but little distinguished for improving the sort of philosophy he had bequeathed them. Among the most considerable were *Marinus* of Flavia Neapolis (Sichem), who succeeded Proclus as a teacher at Athens; and composed his life (see § 219); but subsequently differed from him in his interpretation of Plato; then *Isidorus* of Gaza, who took the place of Marinus at Athens, and afterwards removed to Alexandria; an enthusiastic character but devoid of originality; with *Zenodotus* the successor of the latter, in what they termed the Golden Chain: Still later *Heliodorus* and *Ammonius*, both the sons of Hermias of Alexandria (§ 218); and of whom the latter taught there; then the Egyptians *Heraiscus* and *Asclepiades*, *Asclepiodotus*, *Severianus*, *Hegius*, and *Ulpian*, the brother of Isidorus. To this epoch belongs likewise *John Stobæus* the compiler<sup>d</sup>. The last who taught the Neoplatonic system in the Academy of Athens was *Damascius* (of Damascus<sup>e</sup>), a disciple of Ammonius the son of Hermias, as well as of Marinus, Isidorus, and Zenodotus. He united a certain clearness of understanding to an active imagination; and being dissatisfied with the manner in

Damascius Damascenus flourished in the first half of the sixth century.

which Plotinus had subdivided Primitive Unity into many subordinate Unities, (Triad of Triads—or Ennead), he laboured to reduce every thing to a Simple Unity; at the same time that he admitted the impossibility of adequately comprehending the primordial and abstract principle of all things; and asserted that it was accessible to the human understanding only by means of analogies, and symbols, and that partially.

Among his disciples and those of Ammonius was the celebrated commentator on Aristotle, *Simplicius* of Cilicia<sup>†</sup>; who, as well as his teachers, endeavoured to reconcile Aristotle and Plato. The emperor Justinian having by a severe decree caused the schools of the heathen philosophers to be shut<sup>‡</sup>, Damascius, with Isidorus, Simplicius and others, was obliged to fly into Persia, to the protection of the king Chosroes. They returned indeed A. D. 533, but the ardour of this sect which had so long and so widely prevailed, and had exerted an insensible influence even over the opinions of the Christian philosophers, was manifestly on the decline.

222. The Christian religion was formed for Universality, by its Simplicity, its close alliance with Morality, and the Spirit of its worship, at once mild and severe. Its first teachers justly placed its claim to acceptance on the broad basis of its divine original, and were led to contrast its doctrines with those which had been devised by human reason. The limits of Truth and of Duty had, (if mankind would have been satisfied), been at last defined; and the strange dissensions of inquirers after both, reconciled. But the fact of the divine origin of the religion gave occasion to various questions; and it was asked, how revelation can be established; how it can be ascertained that a doctrine is divine; and what is its true import? Hence the various degrees of authority allowed by different parties to the pretensions of Tradition and Philosophy.

223. The disciples whom Christianity was continually gaining in different countries, were imbued with very different principles and feelings, and many of them had also imbibed some philosophical system or other. The knowledge which such had already acquired of the theories of the Greeks; the necessity of replying to the attacks of Heathen adversaries; and the desire of illustrating the Christian doctrines, and forming into a whole

the solutions which were offered from time to time of the questions and cavils of their adversaries,—all these causes gradually led to the formation of a species of philosophy peculiar to Christianity, which successively assumed different aspects, as regarded its principles and object.

By these means something of the Grecian spirit of philosophy was transfused into the writings of the Fathers of the Church; and in after times proved the germ of original speculations.

224. Many of the Fathers of the Church, especially the Grecian, considered philosophy as in harmony with the Christian religion, (or at least partially so), inasmuch as both were derived from the same common source. This source of truth in the *Heathen philosophy* was, according to *Justin Martyr* (§ 226), derived from Internal Revelation by the λόγος, and Tradition<sup>b</sup>: according to *St. Clement*<sup>i</sup> (§ 226) and the other Alexandrians, it was drawn from Tradition recorded in the Jewish Scriptures<sup>k</sup>; according to *St. Augustine* (§ 232), it was simply *Oral*<sup>l</sup>. In the estimation of all these Fathers Philosophy was, if not necessary, at least useful for the defence and confirmation of the Christian doctrine.

225. Other Fathers of the Church, especially certain of the Latin, as *Tertullian*<sup>m</sup>, *Arnobius*<sup>n</sup>, and his disciple *Lactantius*<sup>o</sup>, surnamed the Christian Cicero, deemed philosophy a superfluous study, and adverse to Christianity, as tending to alienate man from God:—nay, some of them

did not scruple to pronounce it an invention of the Devil, and a fruitful source of heresy<sup>p</sup>.

226. Nevertheless the party which favoured such pursuits gradually acquired strength; and the Fathers came to make use, on the *Eclectic* system, of the philosophy of the Greeks<sup>q</sup>. Accordingly Julian thought that he was taking an effectual method of obstructing the Christian religion when he interdicted to its followers the study of that philosophy. Yet *all* the schools of the ancients were far from meeting with a like acceptation on the part of the Fathers. Those of Epicurus, the Stoics, and the Peripatetics were little considered, on account of the doubtful manner in which they had expressed themselves with regard to the immortality of the Soul, the existence of a Supreme Being, and his Providence; or the opposition which existed between their views and those of Christianity. The Platonic system, on the other hand, from the degree of affinity they affected to discover in it to the Jewish and Christian Revelations, was held in high esteem<sup>r</sup>. Nay, the earliest Fathers themselves belonged to the school of Alexandria<sup>s</sup>. *Justin Martyr*,

affirmed that the *λόγος* previously to His incarnation had revealed Himself to the philosophers of antiquity<sup>†</sup>. *Clement* of Alexandria enlarged on the same idea, and professed to consider Pagan philosophy as an Introduction to Christianity. To these may be added *Athenagoras*<sup>\*</sup> of Athens, and *Tatianus* the Syrian<sup>α</sup>, the Apologists, who both discovered, as they thought, many points of resemblance between the Christian Religion and Platonism. *Origen*<sup>×</sup> the disciple of Clement and the adversary of Celsus, pronounced, with his master, that happiness consists in the contemplation, (*θεωρία*) of the Divinity; and drew a distinction between the popular acceptation of Religion, and the same when thus explained by the learned<sup>γ</sup>; (on which account he came to be considered by some as the first who hinted at the Philosophy of Christianity<sup>δ</sup>). To the same class also belonged *Synesius* of Cyrene<sup>α</sup>, a pupil of Hypatia; *Æneas* of Gaza<sup>β</sup>, and even, —in some respects, *St. Augustine*, (§ 232).

In this manner the Church gradually became reconciled to philosophy; especially after the discussions on

the Arian heresy had taught them the necessity for a more subtle Logic. Nemesis<sup>c</sup>, bishop of Emesa, in his Essay on Man, followed Aristotle (§ 230), and *Boethius* the Roman (§ 234), translated and commented on several of his works on Logic (§ 235).

227. Philosophy was at first employed as an auxiliary to the Christian Religion, to assist in winning over the more cultivated of the Greeks to whom it was addressed; subsequently it was turned to the refutation of heresies; and lastly applied to the elucidation and distinct statement of the doctrines of the Church. Through all these successive gradations the relations of Religion and Philosophy continued always the same: the former being looked upon as the sole source of knowledge, the most exalted and the only *true* philosophy; the latter being regarded as merely a handmaid to the former, and a science altogether earthly,—*scientia mundana*<sup>d</sup>. Logic was exclusively devoted to Polemics.

228. The prevailing system therefore of the Fathers is a Supernaturalism more or less blended with Rationalism. The former daily acquired additional predominance, in consequence of the perpetual disputes with the heretics, who were inclined to place Reason side by side with Revelation: and in consequence also of the resolution of some Christian teachers to put a severe restraint on the waywardness of human interpretation as applied to the Scriptures. Revelation came to be regarded not only as the source of all Christian belief, but as the fountain also of all knowledge, speculative and practical.

*Observation.* The labours of the Fathers in the discussion of the doctrines of Christianity doubtless belongs to the History of

The Deity—and the Relation in which the world and mankind stand to God, are the principal subjects of the speculations of the Fathers; and in these we may observe an evident appeal to the judgment and the understanding.

I. *The Deity.* There are three ways in which God may be known: by His image; from external nature; and by immediate revelation. We find different proofs of the existence of a God drawn from mixed Physics and Theology, from Cosmology<sup>c</sup> and Ontology<sup>f</sup>, noticed by the Fathers; though in general they treat it rather as a matter of faith than knowledge, and appear to have considered the idea of a Divinity as innate, because universal. The nature of God<sup>g</sup> is not capable of being known by the unassisted understanding<sup>h</sup>; at least by any conceptions of our own, without Divine revelation<sup>i</sup>. Some of the Fathers do not express themselves so posi-

<sup>h</sup> DAMASCEN. *de Orth. Fid.* I, 4.

<sup>i</sup> DIONYS. *Areop. Ep.* 5; et *De Mysticâ Theol.*, c. 4, sqq.

tively on this head, inasmuch as they admit the possibility of the application to this great subject of our unassisted ideas and understanding. The greater part of them at first represented the Deity as associated with Space and Time, like a corporeal being<sup>k</sup>: but gradually they corrected these notions, and reduced them to those of Immateriality, or something very nearly approaching to it<sup>l</sup>. Their reflections were more profound than those of the Heathen philosophers respecting the attributes of the Deity, but were not altogether free from the charge of inconsistency.

230. II. *Relation of God to the World.* The Fathers, in opposition to the Manicheans and Gnostics, maintained the Scriptural doctrine of the Creation of the world by the will of God, and its formation out of non-existence. On this a question was moved: Did the Creation take place within the limits of Time? (which St. Athanasius, Methodius, and St. Augustine affirmed); or from all Eternity? (as thought Clement of Alexandria and Origen)<sup>m</sup>: and to what end was it created?

The Fathers admit a general and particular Providence<sup>n</sup>: assert the maintenance and government of the world by the ministry of angels<sup>o</sup>; or, some of them, *without* their ministry<sup>p</sup>. They opposed the fatalism of the astrologers and Stoics<sup>q</sup>, in order to maintain the doctrine of Free-will, and sometimes pushed their speculations on this head farther than, it is probable, they themselves intended<sup>r</sup>. They endeavoured to reconcile the doctrine of the omniscience of God with that of the free-agency of man<sup>s</sup>; and entered largely into the discussion of the origin of physical and moral Evil. Most of them taught

that it was unavoidable<sup>†</sup>, and maintained that it took place neither with nor in opposition to the will of God; in other words, that it was simply *permitted* by Him. They attributed it in part to human agency, in part to the influence of evil Spirits<sup>‡</sup>.—They asserted the existence of spiritual beings endowed with a subtile essence<sup>§</sup>, who minister to the Deity in the government of the world. On the origin of evil spirits are found some superstitious and extravagant notions in the writings of Dionysius the Areopagite<sup>¶</sup>, and Psellus<sup>‡</sup>.

*Anthropology.* Is man composed of two, or of three essential elements, Body, Soul, and Spirit?—as Justin and all the Fathers his immediate successors (all of whom inclined to Neoplatonism), asserted. The human Soul was at first thought material; subsequently however it was pronounced immaterial and spiritual, by the Platonist Fathers: as also by Nemesius and St. Augustine<sup>¶</sup>. As to the origin of souls, they were conceived to be created, by some immediately, by others mediately. (Perpetual creation, or pre-existence of souls). The immortality of the soul was thought by some (St. Augustine) inseparable from its essence; by others, (Justin, Arnobius), a peculiar gift of God, either bestowed on all, or specially on the elect.

III. *Ethics, or relation of Man to God.* The Ethics of the Fathers of the Church are deficient in systematic character; but in detail they are of uncompromising strictness, and tend to elevate man above the dominion of the senses. Their fundamental principle is the will of God, and on the part of man, obedience to that will. The means of becoming acquainted with it are the Scriptures and Reason; the latter subordinate to the former. According to some, God requires the fulfilment of His will in virtue of His almighty power<sup>b</sup>; according to others, with a view to the eternal welfare and felicity of man<sup>c</sup>. According to a third theory, God is at the same time the Sovereign legislator and the Supreme Good, and End, of all reasonable beings. To be united to Him is the height of happiness<sup>d</sup>. To this was appended the doctrine of Duty and Conformity to His will, or Virtue. Sincerity, disinterested love of our neighbour, patience, and chastity, are virtues pre-eminently commended by the Fathers; the three last especially being enforced with peculiar strictness. Free-will, which was at first more largely admitted as a condition of moral action, came to be afterwards limited, and in a manner annulled (§ 232, 253).

A species of ascetic Mysticism subsequently usurped the place of this Morality.

<sup>d</sup> AUGUSTIN. *De Libero Arbitrio*, I, 6; II, 19.

POSSIDIUS Vita Augustini, ed. Jo. SOLINAS, *Rome*. 1731, 8vo. In the *Acta Sanctorum*, tom. V, p. 213, sqq., and in the Benedictine edition of the Works of Augustine, *Paris*, 1677—1700, 11 vol. fol.; 1700—3, 12 vol. fol.

St. Augustine was one of the greatest luminaries of the Latin church\*. After having studied the Scholastic philosophy, and become an ardent disciple of the Manicheans, he was converted to the orthodox faith by the powerful eloquence of St. Ambrose, at Milan, (A. D. 387), and subsequently, (A. D. 405), was appointed bishop of Hippo, and distinguished himself as a zealous preacher, a champion against Heresy, and a copious writer. He employed his philosophical acquirements, and his great and versatile powers in reducing to the form of a system the doctrines of Christianity; and ultimately produced a theory by which it was associated with much of Platonism. According to him, God, the most perfect and exalted of essences, exists of necessity (§ 229): He is the creator of the world (§ 230); Eternal Truth and Eternal Justice; of whom man has certain innate notions, by means of a faculty of intuition superior to the evidence of the senses<sup>f</sup>. God is the supreme good of the Spiritual world, to whom we labour to reunite ourselves<sup>g</sup>. He has called all reasonable beings to the enjoyment of happiness through the practice of virtue; and to that end has endowed them with reason and free-will (§ 231). The use of this free-will is committed to the option of the agent, who, according to his employment of it, approaches to or withdraws himself from God, and renders himself more worthy, or more unworthy, of felicity. Moral evil is negative, and has not any *positive* cause. Evil men are necessary to complete the sum of the Universe, which is perfect; and which would not be perfect without them, inasmuch as it supposes the existence of all possible classes of beings, in all possible

\* Aurelius Augustinus, born at Tagaste in Africa, A. D. 354: died 430.

<sup>f</sup> De Quantit. An. c. 20.

<sup>g</sup> De Civit. Dei, X, 3. De Verâ Relig., c. 55.

degrees<sup>h</sup>. Such was the system of Augustine respecting the Divine Government. In his latter years he rejected this for another: that man, since the fall, has lost immortality, and free-will, as far as the doing of good is concerned, but not as affects the commission of evil; from which principle he deduced the doctrine of absolute Predestination and Irresistible Grace<sup>i</sup>. He was led to this system by a literal adherence to some expressions of Scripture to which he had occasion to refer in his dispute with Pelagius, a British monk; who, with his friend Coelestius, came out of Ireland into Africa, and asserted the free-will of man to do good<sup>k</sup>. St. Augustine likewise originated several new ideas respecting the soul and its faculties, the senses, and the five degrees of Intellectual Power, which have been often revived<sup>l</sup>.

233. The authority of St. Augustine's name contributed to render his latter system the text-book of Dogmatic Science in the West. The destruction of the Roman Empire by the inroad of barbarians, and the obliteration of the remains of ancient literature, contributed to repress the spirit of original inquiry, which had on many subjects been superseded by Revelation. Under such circumstances, the writings of the Fathers were beneficial to philosophy also; as preserving some vestiges of ancient discussions. This was especially true of the works of Augustine, and applies to the treatises on Logic, falsely imputed to him<sup>m</sup>; and which were recommended during the middle ages by the stamp of his name.

234. Besides the dry abstract of what were called the Seven liberal arts, by *Marcianus Capella*<sup>a</sup>, we remark among the works which served as text-books to the ages following, and took a rank intermediate between the ancient and modern philosophies, the works of two Patriarchs of the kingdom of the Ostrogoths, Boethius and Cassiodorus, the last champions of classical literature in the West. Both were Eclectics, and endeavoured to reconcile the doctrines of Plato and Aristotle. *Boethius*<sup>o</sup> lived at the court of the Gothic king Theodoric, who caused him to be beheaded under a false suspicion of high treason<sup>p</sup>. By him principally was preserved in the West some faint knowledge of the system of Aristotle. He translated some treatises of that philosopher on Logic, and wrote a commentary on the translation of the *Isagoge* of Porphyry by *Victorinus*, which was looked upon as a preparation for the study of Aristotle. He also composed, in his prison at Pavia, his treatise *De Consolatione Philosophiæ*, which became a great favourite with following ages. His contemporary *Cassiodorus*<sup>q</sup>, also preserved, especially in his work *De Septem Disciplinis*, some relics of Grecian philosophy; and encouraged the monks to transcribe the ancient MSS.

<sup>a</sup> Marcianus Minæus Felix Capella, flourished about 474. His work entitled, *Satyricon*, has been frequently printed, (see FABRIC. Bibl. Lat. tom. I, p. 638), and lastly by J. A. GÖTZ, *Norimb.* 1794, 8vo.

## PART THE SECOND.

### SECOND PERIOD.

---

#### HISTORY OF THE PHILOSOPHY OF THE MIDDLE AGES,

OR, THE SCHOLASTIC SYSTEM; FROM THE COMMENCEMENT OF THE NINTH TO THE SIXTEENTH CENTURY.

*Attempts of the Understanding towards the cultivation of Science, under the influence of an extraneous principle and positive laws.*

---

*History of the Philosophy of the Middle Ages and of the Schoolmen. (From 800 to the Fifteenth Century).*

236. The spirit of philosophical curiosity which had possessed so much influence throughout the preceding period, dwindled to a very slender thread, and influenced in a very inferior degree the public mind during the days of barbarism and ignorance, on which we are about to enter. At the same time a new System and new Method were contained in embryo in the precious remains of old philosophy, and acquired the name of the *Scholastic*; because it was principally formed in the schools founded since the time of Charlemagne<sup>a</sup>. That great monarch,

<sup>a</sup> See the Work of LAUNOY, § 243; and J. M. UNOLD, de Societate Literaria a Carolo M. instituta, Jen. 1752, 4to.

It must not be forgotten, however, that such studies were cultivated at a still earlier period in Great Britain. See MURRAY, De Britannia atque Hibernia Sæculo a sexto inde ad decimum literar. domicilio; in the Nov. Comment. Soc. Gott. tom. II, part II, p. 72.

so astonishingly superior to the age in which he lived, very properly began the work of civilization by establishing elementary schools for the clergy, where were taught, in the jejune sketches of *Marcianus Capella*, *Cassiodorus*, and *Bede*, the Seven Liberal arts, or, as they were termed by Boethius, the *Trivium* and *Quadrivium*. Charlemagne founded likewise an Academy attached to his court, as well as a school for the instruction of those destined for public affairs; and for the improvement of the latter he invited, principally from England, several men of eminent merit. (See *Alcuin*, § 244). His successors also encouraged the establishment and maintenance of Schools for the clergy, in the convents and episcopal sees.

237. In these schools, and still more in the universities which were subsequently formed, especially in that of Paris, the model of all the rest, a degree of zeal for science, as considerable as could be expected from the information and circumstances of the ecclesiastics for whom these seminaries had been principally designed, gradually unfolded itself. An alliance was now formed between Faith, which implicitly received the doctrines which the hierarchy of the Romish church maintained, and Reason, which laboured to investigate the principles of the same truths. The means employed were Logic and Metaphysics, or Dialectics. This was the origin of the scholastic philosophy, which was engaged in the application of Dialectics to Theology, (such as it was established by St. Augustine), and an intimate association of these two sciences.

238. The Human mind thus endeavoured at once, without any substantial knowledge or previous discipline, to grapple with the greatest of all questions, the Nature of the Divinity; and by a course the reverse of that pursued by Grecian philosophy, beginning with this great principle, sought in its descent to embrace the circle of all acquired knowledge. The impulse was given by Theology;

which always continued to be the principal moving power, as well as object. At first nothing more was designed than the confirmation of certain isolated doctrines by the authority of an appeal to Reason as well as Revelation; subsequently men were desirous of binding together into a sort of system, the results of these reasonings; in the end it was their endeavour to consolidate, confirm, and define the sphere of knowledge which by such means they had extended.

239. Revelation had already supplied the great results of such inquiries on the most important particulars. All that remained, and all they attempted, was to invest those results with the formalities of a science. All that could be obtained by investigation had been already defined, and was strictly maintained by the Church; nor were the means employed—Dialectics—less absolutely fixed by usage. The circle of mental activity was consequently confined; and a spirit of minute subtilty began to prevail, more especially in establishments cut off from large communication with the great world, which amused the inquisitiveness of the human mind by the discussion of puerile formularies, and a sort of intellectual see-saw applied to ideas instead of realities.

240. Philosophy at first dwindled into a mere logical skeleton after the manner of Boethius and Cassiodorus; and more recently, in conformity to the sketch of Bede (§ 234), which was adopted as his model by Alcuin; and finally, after the system attributed to St. Augustine (§ 233). It became indeed somewhat more enlarged after they had acquired from the Arabs some slight acquaintance with the Aristotelian philosophy, by means of rude translations from the Arabic and Greek. In spite of the opposition it at first encountered, and the imputation of heresy, this philosophy became daily more prevalent, and ultimately of universal influence, in consequence of being allied to Theology.

241. It is not possible to define with accuracy the du-

ration of the empire of scholastic philosophy. It began in the ninth century<sup>b</sup>, and has in some degree survived to our own days; but the revival of classical literature and the Reformation deprived it for ever of that unlimited authority which it possessed before.

242. Four epochs may be defined in the history of this philosophy, deducible from the history of the question concerning the *Reality* of Ideas; and the relations of Philosophy to Theology. *First period*, down to the eleventh century:—A blind *Realism*<sup>c</sup>, with attempts to apply the elements of Philosophy to Theology.—*Second period*, from *Roscellin* to *Alexander of Hales*, or *Alesius*, at the commencement of the thirteenth century.—The first appearance of Nominalism and of a more liberal system of inquiry, quickly repressed by the ecclesiastical authorities, which established the triumph of Realism. A more close alliance was consequently brought about between philosophy and theology.—*Third period*, From *Alexander* and *Albert*, surnamed the Great, to *Occam*:—thirteenth and fourteenth centuries. During this period, Realism had exclusive dominion: the system of instruction adopted by the Church was consolidated by the introduction of the Aristotelian system; and philosophy became still more closely connected with theology.—The age of *St. Thomas Aquinas* and *Scotus*.—*Fourth period*, From *Occam* to the sixteenth century.—A continued contest between Nominalism and Realism, wherein the former obtained some partial successes. Philosophy was gradually detached from Theology, through the renewal of their old debates. Some other disputes grew out of the attempt to introduce reforms in the systems of both.

*Observation.* Three different relations subsisted between Philosophy and Theology during these periods: 1st. Philosophy

<sup>b</sup> The origin of Scholastic philosophy is often referred to the epoch of Roscellin, about the end of the eleventh century; or to the twelfth century; or lastly, (as Tiedemann does), to the commencement of the thirteenth.

<sup>c</sup> [Realism supposes our ideas to have a real essence: Nominalism the contrary. TRANSL.]

was considered merely *subordinate*: as the *Ancilla Theologiæ*: 2dly. It was associated with the latter on a footing of equality: 3dly. They were mutually separated and divorced.

243. In examining the philosophy of these ages we ought, (making due allowance for the circumstances of the times, and not appreciating what was effected then by what might be achieved now), to allow all their merit to superior minds without laying to their charge the faults of their age and their contemporaries; and to show ourselves sensible to the good as well as to the evil of the Scholastic system. Among its good results were an increased ability in the management of doctrinal metaphysics, a great subtilty of thought, and a rare sagacity in the development and distinction of ideas, with individual efforts on the part of several men of genius, notwithstanding the heavy bondage in which they were held. The ill effects were, the dissemination of a minute and puerile spirit of speculation, the decay of sound and practical Reason, with a neglect of the accurate and real sciences and of the sources whence they are to be derived, that is: —Experiment, History, and the Study of Languages. To these must be added the prevalence of the dominion of Authority, and Prescription; Bad Taste; and a rage for frivolous distinctions and subdivisions, to the neglect of the higher interests of science.

## FIRST PERIOD OF THE SCHOLASTIC PHILOSOPHY.

### I. *Absolute Realism down to the commencement of the Eleventh Century.*

#### *Alcuin.*

244. The attempts of a spirit of Philosophy at this period were feeble and imperfect, but they might have been more successful but for the constraint imposed by the Hierarchy. Such a state of things permitted the existence of only a small number of superior writers, who shed a doubtful light amid the general gloom of igno-

rance, and laid the foundations of the Scholastic system. The first of these, in the order of time, was the Englishman *Alcuin* or *Albinus*<sup>d</sup>, whom Charlemagne brought with him from Italy to his court. This learned writer (for the times in which he lived) wrote upon the *Trivium* and *Quadrivium*<sup>e</sup> (§ 240). His pupil *Rhabanus Maurus* introduced his dialectics into Germany<sup>f</sup>.

*Johannes Scotus Erigena.*

† Johannes Scotus Erigena, or an Essay on the Origin of Christian Philosophy, and its sacred character, by PEDER HJORT, *Copenh.* 1828, 8vo.

245. *John Scotus*, an Irishman (hence his surname of *Erigena*), belonged to a much higher order: a man of great learning, and of a philosophical and original mind; whose means of attaining to such a superiority we are ignorant of. He was invited from England to France by Charles the Bald, but subsequently obliged to quit the latter country; being persecuted as a heretic. At the invitation of Alfred the Great he retired to Oxford, where he died about 886.

His acquaintance with Latin and Greek (to which some assert he added the Arabic); his love for the philosophy of Aristotle and of Plato, his translation, (exceedingly esteemed throughout the West), of Dionysius the Areopagite (§ 235); his liberal and enlightened views (which the disputes of the day called upon him to express), respecting predestination<sup>g</sup>, and the eucharist,—all these entitle him to be considered a phenomenon for the times in which he lived. Add to this, that he regarded philosophy as the Science of the Principles of all

<sup>d</sup> Born at York 736, died 804.

<sup>f</sup> Born at Mentz 776; died archbishop of that city 856.

<sup>g</sup> See on this subject his treatise, *De Divinâ Prædestinatione et Gratiâ*, in GILB. MANGUINI Vett. Auctt. qui IX. Sec. de Prædestinatione et Gratia scripserunt, *Opera et Fragmenta, Paris*, 1650, tom. I, p. 103, sqq.

things, and as inseparable from religion; and that he adopted a philosophical system<sup>h</sup>, (a revived Neoplatonism), of which the foundation was the maxim: That God is the essence of all things; that from the plenitude of His nature they are all derived, and to Him ultimately return (*Primordiales causæ—natura naturata*). His labours, enlightened by so much learning and suggested by so much talent, might have accomplished more if they had not been blighted by the imputation of heresy.

*Berenger and Lanfranc.*

246. Next in order comes *Gerbert*, a monk of Aurillac, who afterwards became pope Sylvester II.<sup>i</sup>, and acquired, at Seville and Cordova, extraordinary information, for that time, in the mathematics and Aristotelian philosophy of the Arabs, which he disseminated in the schools or monasteries of Bobbio, Rheims, Aurillac, Tours, and Sens<sup>k</sup>. After him appeared *Berenger* of Tours<sup>l</sup>, who was distinguished for his talents, his learning, and his

<sup>i</sup> Born in Auvergne; pope A. D. 999; died 1003.

<sup>k</sup> His Dialectic treatise, De Rationali et Ratione Uti, is to be found in the Thesaur. Anecd. PEZII, t. I, part 2, p. 146: and his Letters in DUCHESNE, Hist. Franc. Scriptt., t. II, p. 789, sqq.

<sup>l</sup> Con. Berengarius, born about the commencement of the eleventh century, died 1088.

freedom of opinion, by which he drew upon himself some severe persecutions, in consequence of discussions on the subject of transubstantiation\*. His opponent *Lanfranc*<sup>m</sup>, as well as the cardinal Peter *Damianus*, or *Damien*<sup>n</sup>, brought to perfection the art of Dialectics as applied to Theology: and his skill therein gave to the former (in the opinion of his contemporaries), the advantage over Berenger. This discussion, which was subsequently revived, had the effect of tightening still more the bonds of Papal authority.

*St. Anselm of Canterbury.*

ANSELMI Cantuariensis Opp. lab. et stud. D. G. GERBERON, *Paris*. 1675 ; second edition, 1721 ; *Venet*. 1744, 2 vols. fol.

EADMERI Vita S. Anselmi, in the *Acta Sanctorum* Antw., April, t. II, p. 685, sqq., and in the edit. of the Works of Anselm above.

† A. RAINERI, Panegyric Hist. of St. Anselm, *Modena*, 1693—1706, 4 vols. 4to. : and JO. SARISBURIENSIS De Vitâ Anselmi, WHARTON'S *Anglia Sacra*, part II, p. 149.

247. *St. Anselm*, the pupil and successor of Lanfranc (whom we must not confound with the schoolman his contemporary, Anselm of Laon)<sup>o</sup>, was born at Aosta in 1034: became prior and abbot of the monastery of Bec, and died, archbishop of Canterbury, 1109. He was a second Augustine; superior to those of his age in the clearness of his understanding and powers of Logic; and equal to the most illustrious men of his day for virtue and piety. He planned a system of religious philosophy, to be effected by combining the results of controversies on such subjects, in accordance, for the most part, with the views of St. Augustine. For this purpose, he composed his *Monologium sive Exemplum Meditandi de ratione Fidei*; in which he endeavoured to state systematically the great truths of religion on principles of common reason, but at

\* Liber BERENGARII Turonensis adversus Lanfrancum ex Cod. Mscpt. Guelpherbit. edit. a STÄUDLINO, *Gott*. 1823, 4to. (Progr. III.)

<sup>m</sup> Born at Pavia 1005; died, archbishop of Canterbury, 1089.

<sup>n</sup> Of Ravenna; born 1001, died 1072.

<sup>o</sup> Died A. D. 1117.

the same time presupposing the more solid foundation of religious conviction. To this he added his *Proslogium*, otherwise called, *Fides quærens Intellectum*; where he seeks to prove the existence of God from the fact of our idea of an Almighty power. A monk of *Marmoutier*, named *Gaunilon*, ably attacked this sort of ontological argument<sup>p</sup>. Anselm may be looked upon as the inventor of Scholastic Metaphysics, inasmuch as he afforded the first example of it; though other systems subsequently superseded his own, and some of his ideas were never followed up.

### *Hildebert of Tours.*

Hildeberti Turonensis Opera ed. ANT. BEAUGENDRE, *Paris*. 1708, fol.; and in the *Biblioth. Patrum* of GALLAND, t. XIV, p. 337, sqq.

† W. C. L. ZIEGLER, *Memoirs towards a Hist. of the Theological Belief in the Existence of a God, with an Extract from the first Dogmatical System (in the West) of Hildebert, archbishop of Tours*, *Gött.* 1792, 8vo.

248. *Hildebert* of Lavardin, archbishop of Tours<sup>q</sup>, and, as is probable, the disciple of Beranger, was equal to Anselm in sagacity and ability as a logician; and possessed the advantage of a more popular style, and more various information. To an acquaintance with the Classics and other accomplishments, rare in his age, he added independence of mind, a practical understanding, and a degree of taste which preserved him from falling into the vain and puerile discussions of his contemporaries. His *Tractatus Philosophicus*<sup>r</sup> and his *Moralis Philosophia*, are the first essays towards a popular system of Theology. Othlo and Honorius, two monks of the same period, opposed themselves to the Logicians, and shut themselves up in impregnable mysticism.

<sup>p</sup> Gaunilonis liber pro insipiente adversus Anselmi in Proslogio ratiocinantem; together with Anselmi Apologeticus contra insipientem. (In the works cited above).

<sup>q</sup> Born between 1053 and 1057; died about 1134.

<sup>r</sup> Part of this treatise is comprised in the works of Hugo de St. Victor.

## SECOND PERIOD OF THE SCHOLASTIC PHILOSOPHY.

### II. *Disputes between the Nominalists and Realists, from Roscellin (end of the Eleventh Century) to Alexander of Hales.*

JAC. THOMASII Oratio de Sectâ Nominalium; Orationes, Lips. 1683 et 86, 8vo.

#### *Roscellin.*

249. The practice of Dialectics, and the questions arising out of a disputed passage in Propyry's Introduction to the Organum of Aristotle (*επι της γενικής*), respecting the different metaphysical opinions entertained by the Platonists and Peripatetics of the nature of General Ideas,—Such were the causes which led to the division between the Nominalists and Realists, the latter adhering to Plato, the first to Aristotle: disputes which stirred up frequent and angry debates in the schools, without any other result than that of sharpening their powers of argumentation\*. This long discussion was begun by John *Roscellin* (or *Roussellin*), a canon of Compiègne<sup>†</sup>, who, (on the testimony of his adversaries), maintained that the ideas of Genus and Species were nothing but mere words and terms (*flatus vocis*), which we use to designate qualities common to different individual objects<sup>‡</sup>. He

\* JOH. SALISBURIENSIS Metalog., c. 11, 16, 17.

† About 1089.

was led on by this doctrine to some heretical opinions respecting the Trinity, which he was ultimately compelled to retract at Soissons, A. D. 1092. It is certain that Roscellin is the first author who obtained the appellation of a Nominalist, and from his time the school previously established, which held the creed that Genus and Species were real essences, or types and moulds of things, (*Universalia ante rem* according to the phrase of the Schoolmen), was throughout the present period perpetually opposed to Nominalism, whose partisans maintained that the *Universalia* subsisted only *in re*, or *post rem*: nor was the difficulty ever definitively settled.

### *Abelard.*

† F. C. SCHLOSSER, Abailard and Dulcin. Life and Opinions of an Enthusiast and a Philosopher, *Gotha*. 1807, 8vo.

J. H. F. FRIEDRICH, Comment. Theol. Crit. de P. Abelardi Doctrina Dogm. et Morali, (prize comp.), *Jen.* 1827, 4to.

250. A celebrated discussion took place in the School of Paris on the nature of General Ideas and their connection with their subject-matter, between *William de Champeaux*<sup>\*</sup>, a renowned Logician, and *Peter Abelard*, or Abeillard, his pupil and opponent. Abelard, who by some has been considered the first in point of time of the Scholastic philosophers, employed in the debate none but negative arguments; but proved himself to be endowed with some qualifications superior to the narrow dispute in which he was engaged. He was born at Palais, a village near to Nantes, A. D. 1079, and possessed rare abilities which were sedulously cultivated. To great talents as a

<sup>\*</sup> G. Campellensis: he died bishop of Châlons, A. D. 1120.

logician, he added an extensive acquaintance with Grecian philosophy; borrowed, it is true, from St. Augustine and Cicero. The perusal of the Classics had imparted to his mind a certain elegance as well as elevation, which set off his style in teaching and writing, and which at this period was rare, and proportionably admired. He evinced even greater boldness than Anselm in his attempts to re-state on general principles the grand doctrines and mysteries of Christianity, particularly that of the Trinity<sup>y</sup>. He also attempted, as Hildebert had done before him (§ 248), to explain, on philosophical principles, the chief points of Theological Morality, as, for instance, the ideas of Vice and Virtue. He made *both* to consist in the mental resolution, and denied that our desires in themselves are of the nature of sin<sup>z</sup>. His talents as a teacher attracted an immense crowd of admirers from among the young men at Paris, and increased the celebrity of its university; but at the same time, his reputation drew upon him the envy of others, which, backed by his ill-fated passion for Eloisa, and the zeal of theologians rigidly attached to the doctrines of the Romish church, and in particular the jealousy of St. Bernard, embittered the remainder of his life; and diminished the influence his talents would otherwise have possessed. He died at Clugny, 1142.

251. In spite of the persecutions of Abelard a great number of men of talents were willing to tread in his steps, and attempted, with various success, to associate Philosophy with Theology. The principal were *G. de Conches*<sup>a</sup>, and *Guilb. de la Porrée*, born in Gascony, and bishop of Poitiers<sup>b</sup>; *Hugh de St. Victor*, of Lower

<sup>y</sup> In his *Introductio ad Theol. Christian.*, libb. III. seu *De Fide Trinitatis*, libb. III: see his *Works*, p. 973 sqq.: and in the larger *Treatise: Theologia Christiana*, libb. V, given by EDM. MARTENE, *Thes. Nov. Anecd.*, t. V.

<sup>z</sup> *Ethica*, seu *liber dictus Scito te ipsum*, in PEZII *Thes. Noviss. Anecdotorum*, t. III, part 2, p. 625.

<sup>a</sup> Died 1150.

<sup>b</sup> On that account surnamed *Pictaviensis*. Died 1154.

Saxony or Flanders<sup>c</sup>; *Robert (Foliot?) of Melun*<sup>d</sup>; *Robert Pulleyn*, the Englishman<sup>e</sup>; *Peter*, surnamed *Lombardus*, bishop of Paris, born in a village near Novara, in Lombardy, and died 1164. To these must be added the disciple of the latter, *Peter of Poitiers*<sup>f</sup>; *Hugh of Amiens*<sup>g</sup>; *Richard de St. Victor* the mystic<sup>h</sup>; *Alain de Ryssel*<sup>i</sup>, etc. The most distinguished was *Lombardus*, in consequence of his *Libri Sententiarum*, which procured him the additional appellation of *Magister Sententiarum*<sup>k</sup>. In these he put together extracts from the Fathers on different points of faith, without adding any solution of the difficulties that occurred; supplying an abundant treasury of disputation for the logicians of his time. His works became popular—a sort of storehouse and armoury for ecclesiastical polemics; though others of those we have mentioned possessed more real merit; for instance, the two mystics, *Hugh de St. Victor*, surnamed the Second Augustine, a man of an elegant and philosophical mind; and his pupil *Richard de St. Victor*, who to his mysticism added considerable acuteness. Pulleyn also was the author of a clear and enlarged account of the correspondence of Doctrines with the principles of Reason; and finally, *Alain de Ryssel* applied to these matters the exactness of a mathematical method.

<sup>c</sup> Born 1096, Died 1140.

Ejusd.: Opera stud. et industr. Canonorum Regiorum Abbat. St. Vict. Rothomag. 1618, 3 vols. fol.

<sup>k</sup> PETRI LOMBARDI libri IV Sententiarum: frequently published, particularly Ven. 1477, fol.; Colon. 1576, 8vo. See BOSSUET and CRAMER's Hist. part. VI, § 586.

252. *John of Salisbury* (J. parvus Sarisburiensis<sup>1</sup>), a pupil of Abelard, and a man of classical erudition, in spite of his predilection for Aristotle clearly perceived the faultiness of the philosophy of his age, and the futility of that Logic which he attacked with considerable ability<sup>m</sup>. Dialectics came in the end to be employed both for and against the system of the Church, as was shown by the example of *Simon de Tournay* (Tornacensis), of *Amalric* (or Amauric de Bene, in the district of Chartres, who died 1209); and by his pupil *David de Dinant*. Besides a great number of paradoxical doctrines, the last taught a species of Pantheism, borrowed it is probable, from J. Scot Erigena<sup>n</sup>. These heretics justly turned into derision the School Dialectics. In the midst of the absurdities of the age, a certain independence of Thought manifested itself; very rude indeed as yet, but prepared to offer some opposition to dogmatising authority. By means of persecutions, anathemas, and interdictions, the adverse party succeeded in subduing it, for the time.

The most distinguished leaders of the latter were St. Bernard\*, abbot of Clairvaux (born 1091, died 1153), and Walter, abbot of St. Victor.

### THIRD PERIOD OF THE SCHOLASTIC PHILOSOPHY.

*Exclusive dominion of Realism; Complete alliance between the Church and the Aristotelians, from Alexander of Hales to Occam.*

J. LAUNOJUS, De Variâ Aristotelis Futurâ. (Above, at the head of § 244).

253. It was precisely at the time when every thing ap-

<sup>1</sup> Died bishop of Chartres 1180.

<sup>m</sup> In his POLICRATICUS, sive de Nugis Curialium et Vestigiis Philosophorum, libb. VIII; et METALOGICUS, libb. IV, Lugd. Bat. 1639, Amst. 1664, 8vo.; and in his CCCI Epist., Paris. 1611, 4to.

<sup>n</sup> GERSON, De Concordiâ Metaphysicæ cum Logicâ, part. IV. THOMAS Aq. Lib. Sent. II, dist. 17, Qu. I, a. I. ALBERTI Summa Theol. part I. Tract. IV, Qu. 20.

peared to have a tendency to discard the philosophy of Aristotle from all interference with the doctrines of the church, that it acquired the greatest ascendancy. About the year 1240 men began to be better acquainted with his works *collectively*, in consequence of being brought into contact with the Greeks, who had never altogether deserted him<sup>o</sup>; and still more through the Arabians. The very circumstance that the perusal of these works was prohibited in 1209, 1215, and 1231, increased the avidity with which they were read to such a degree, that the Dominicans and Franciscans, the staunchest maintainers of orthodoxy, who had recently assumed authority in the University of Paris, eagerly devoted themselves to the same study.—The following question appears of interest: How was it that the works of Aristotle came to be known in the West? From the East by the way of Constantinople, or by the way of Spain through the Arabs<sup>p</sup>? From this question is to be excepted the *Or-*

<sup>o</sup> In the eleventh century appeared in the Greek empire the philologist MICHAEL CONSTANTINE PSELLUS, born 1020 died about 1100: the author of Commentaries on Aristotle and Porphyry; Paraphrasis Libri Arist. de Interpretatione, Gr., with the Commentaries of Ammonius and Magentinus, about 1503. Compendium in Quinque voces Porphyrii et Aristotelis Prædicamenta, Gr., Paris. 1541; and *σύνοψις ἐς τὴν Ἀριστοτέλους Λογικὴν* Gr. et Lat., Aug. Vind. 1597; besides *Introductio in sex Philos. Modos*, etc., Gr. c. Lat. vers. JAC. FOSCARINI, Ven. 1532, Paris. 1541, 12mo.; and a book on the Opinions of the old Philosophers respecting the Nature of the Soul, Gr. et Lat., with, *Originis Philocalia*, Paris. 1618 and 1624, 4to., subsequently reprinted. To Psellus succeeded EUSTRATIUS, metropolitan of Nicæa, in the beginning of the twelfth century, (FABRIC. Bibl. Gr. lib. III, c. 6, p. 151, sqq. note a.), and other writers of the thirteenth century, who abridged the Logic of Aristotle; such as, NICEPHOR. BLEMMYDES (flourished about 1254), and GEOR. ANEPONYMUS (*Nicephoræ Blemmydæ Epitome Logicæ Doctrinæ Aristotelis*, Gr. et Lat. Aug. Vindel. 1606, 8vo.; *GEORGII ANEPONYMI Compendium Philos. siv. Organi Aristot.* Gr. et Lat. Aug. Vind. 1600); GEOR. PACHYMERUS, who survived till 1310, author of a Paraphrase of the Philosophy of Aristotle in general, of which extracts have been published, (Gr. et Lat. Oxon. 1666, 8vo., *Epitome Philos.* Bas. 1560, Lat. fol.); and THEOD. METOCHITES, who survived till 1332, and commented on the works of Aristotle relating to Physics (FABRIC. Bibl. Gr. vol. IX).

<sup>p</sup> See BUHLE, *Manual of the History of Philosophy*, part. V, p. 247. HEEREN, *History of the Study of Classical Literature*, vol. I, p. 183. This question has been thoroughly discussed, and decided in favour of a Saracenic

*ganum*, which was known as early as the time of Charlemagne; having been sent as a present to him from Constantinople.

### *Arabians.*

254. The Arabians, originally devoted to Sabeism, had received a fresh impulse from the doctrines of Mahomet, which suited well their ardent temperaments and inquisitive minds. He died 632; but the flame was kept alive by the fiery zeal of his successors, who insisted more and more on his pretended mission from on High. In a short time they had subjected to their belief a large portion of Asia, Africa, and Europe. Their relations with the conquered nations, especially the Syrians, Jews, and Greeks; the progress among them of luxury, and all its consequences; the demand for foreign physicians and astrologers, and the influence acquired by the latter, engendered among them an ardent emulation for the sciences, which was encouraged in every way by the caliphs of the house of the Abassides, Al Mansour<sup>a</sup>, Al Mohdi<sup>r</sup>, Haroun al Raschid the contemporary of Charlemagne<sup>s</sup>, Al Mamoum<sup>t</sup>, and Motassem<sup>u</sup>; who caused the Greek authors to be translated into Arabic, founded schools, and collected valuable libraries<sup>x</sup>.

origin, in the following prize composition of the Academy of Inscriptions and Belles Lettres, at Paris: Critical Inquiry respecting the Age and Origin of the Latin Translations of Aristotle, and the Greek or Arabic Commentaries employed by the Schoolmen, etc., by M. Aristotle and his commentators down to J. Philoponus, were almost the only philosophers who found favour with the Arabians. The body of his philosophy they received indeed only through the doubtful medium of Neoplatonism, and by means of inadequate translations<sup>y</sup>. To the study of these they added Mathematics, Natural History, and Medicine. But many obstacles were in their way. In the first place the Koran, which opposed limits to the free exercise of their understandings: the opposition also of a formidable party who pretended to maintain the orthodox belief: the difficulty of understanding Aristotle himself: and the absolute supremacy they presently accorded to him: lastly, their national tendency to exaggeration and superstition. All therefore they effected was to interpret, and very frequently to misinterpret, the system of that philosopher, without ever ad-

of the Eastern Nations; prefixed to his *Persian, Arabic, and English Dictionary*, *Oxford*, 1777, fol.

vancing beyond him; attempting to apply his principles to their own blind faith. The consequence was, an abundant harvest of futile refinements. To such a philosophy was superadded, accidentally, a sort of mysticism; especially among the Pantheistic sect of the *Sofis* or *Ssufis* (*Sofismus*, *Sufismus*), founded before or during the second century of the Hegira, by *Abou Said Abul Cheir*; a sect which continues to survive in sufficiently large numbers in Persia and India<sup>a</sup>.

After all, the records of Arabic philosophy have been too little investigated to enable us to speak of them with sufficient certainty.

256. The principal Arabian philosophers (for the most part exclusively devoted to the system of Aristotle), were:

1. *Alkendi*, or *Alkindi*<sup>a</sup>, of Basrah, a physician and philosopher, the master of copious and various learning, and well versed in the Sciences. He flourished, A. D. 800, under the reign of Al Mamoum. 2. *Alfarabi*<sup>b</sup> of Balah, in the province of Farab, who died A. D. 954; a man of superior parts; and styled the *second* teacher of intellectual knowledge. His Logic, as well as his treatise on the origin and subdivision of the Sciences, was greatly in vogue with the schoolmen. 3. *Avicenna*<sup>c</sup>, born about 980, at Bochara: died 1036. He devoted himself especially to Logic and Metaphysics (which he thought the first of the Sciences, inasmuch as it has for its subject Being in the Abstract); as well as to Medicine and Alchemy. He manifested an original vein of thought in his

<sup>a</sup> *Ssufismus sive Theosophia Persarum Pantheistica*, quam e MSS. Biblioth. Regiæ Berol., Persicis, Arabicis, Turcicis eruit atque illustravit FRIEDR. AUG. DEOFIDUS THOLUCK, *Berlin*, 1821, 8vo. The opinion of this author is, that Sofism had its origin neither in India nor Persia, but in the religion of Mahomet itself. His hypothesis is controverted by the author (Qu. M. HAMMER?) of a critique in the Lit. Gaz. of Leipsic (1822, Nos. 252—258), on an important work relative to Oriental Mysticism, entitled, *Reschati Ainol Hajat*, etc.

<sup>a</sup> Otherwise called Abu Yusuf (Jacob) Ebn Eschak (Isaac) Al Kendi.

<sup>b</sup> Abu Nasr Mohammed Ebn Tarchan Al Farabi.

<sup>c</sup> Abu Ali Al Hosain Ebn Sina Al Schaüch Al Raus.

commentary on the *Metaphysics* of Aristotle<sup>d</sup>. He there asserts that it is no more possible to assign a definition of Absolute Being, than it is to give one of *the Necessary, the Possible, and the Real*. From the abstract notion of Necessity, he concludes that what is necessary is without an efficient cause; and that there is only one Being existing of Necessity. 4. *Algazel* of Tus<sup>e</sup>, an acute Sceptic, who proved himself able to defend the cause of a Supernatural revelation with ability in opposition to the doctrine of Emanation, as well as that of the harmony of causes, and the materiality of the Soul; with many others of the opinions of the Aristotelians and Neoplatonists. He maintained the infallibility of the Koran, and asserted the miracles of Mahomet to be incontestible proofs of his mission. 5. *Thophail*, or *Abubekr*<sup>f</sup>, of Cordova; died at Seville 1190. He was distinguished for his philosophical romance *Hai Ebn Yokdan*, or the Man of Nature<sup>g</sup>; in which he sets forth with ability the enthusiastic doctrine of the Neoplatonists respecting intuition.

### *Averroes.*

Commentary of Averroes on the Arabic trans. of Aristotle: in various editions of the Works of Aristotle, *Ven.* 1562; vol. II. Besides his work: *Destructio destructionis Philosophiæ ALGAZELIS*, in the Latin translations, *Venet.* 1497, and *Venet.* 1527, fol. See FABRICII *Bibl. Gr.* XIII, p. 282, sqq.

257. 6. *Averroes*<sup>h</sup>, the disciple of Tophail, was born at Cordova, and died at Morocco, 1206 or 1217. He was the most celebrated of the learned men of his nation, and the close and almost servile follower of Aristotle. He was styled, by way of eminence, *the Commentator*; and,

<sup>d</sup> *Metaphysica* per BERNARD. VENETUNI, *Venet.* 1493. Opera, *Ven.* 1523, 5 vols. fol.; *Bas.* 1556, 3 vols.

<sup>e</sup> Abu Hamed Mohammed Ebu Mohammed Ebn Achmed Al Gazali, born 1072, died 1111.

<sup>f</sup> Abn Dsafir Ebn Thophail.

<sup>h</sup> Abul Walid Mohammed Ebn Achmed Ebn Mohamed Ebn Rashid.

in spite of the great number of his secular employments, was a most copious writer. His treatment of Aristotle ought to be appreciated by a reference to the state of opinions in his day. Though he professed to do no more than interpret him, he imputed to him many opinions which in reality were not his: blending with his system the Alexandrian doctrine of Emanation, in order to assign a living First-principle to account for all contingent things. His theory of an active Intelligence is a necessary consequence of this manner of interpreting the doctrine of Aristotle. The great Primal Essence produces all the various modifications of things, not by the way of Creation, (because—*ex nihilo nihil fit*) but by uniting matter and form, or by developing the form involved and contained in the matter<sup>1</sup>. Thought, as well as sensible Perception, supposes three things: a material, and, as it were, a formal understanding; the one being impressed, the other receiving the impression; as well as a power to communicate the impression. There exists an Universal—Active Intelligence, in which all mankind partake equally, and which is derived to us from without: its principle being, perhaps, the same which influences the moon<sup>2</sup>. Averroes was a man of a clear-sighted enlightened mind, who believed in the authority of the Koran, but regarded it as a sort of exoteric doctrine, the foundation of which he sought to place on scientific grounds<sup>3</sup>.

### *Sects of Arabian Philosophers.*

258. Speaking generally, the Arabian philosophers were divided into two parties; viz. the philosophers simply so called (Idealists), who, according to the belief of the Platonists of Alexandria, held that the world was eternal, and endeavoured to unite this belief to their own prescribed religion; to which school belonged also the As-

<sup>1</sup> AVERROES, lib. XII, Metaphys.

<sup>2</sup> AVERROES, De Animæ Beatitudine. Epitome Metaph. Tract. IV. Cœl. Rhodog. Ant. Lect. lib. III, c. 2.

<sup>3</sup> See M. HAMMER'S work, cited above, for a list of several Arabian philosophers of more recent date, and less reputation.

cetics or Sofis (§ 255): and, secondly, the *Medabberins* (Dialectic philosophers, or reasoners), who took their ground on the positive doctrines of the Koran; endeavoured to explain, on philosophical principles, the origin of the world; and combated the Idealists<sup>m</sup>. We are not as yet perfectly acquainted with these two sects. A third likewise is mentioned, that of *Assariah*, or falalists, who referred every thing to the will of God.

### *Jews.*

259. The doctrines of the Arabians were communicated to the Christian world principally through the medium of the Jews, who imported them from Egypt, where the sciences had been prosecuted with great ardour. The Jews themselves took a prominent part in philosophical researches, and were distinguished for more than one philosopher. Of this number was *Moses Maimonides*<sup>n</sup>: born at Cordova, A. D. 1139, and brought up under Theophail and Averroes, and inclined to the study of Aristotle; but for these reasons persecuted by the fanatical part of his own countrymen, up to the period of his death; which happened in 1205. In his work entitled *More Nevochim* (*Doctor Perplexorum*<sup>o</sup>), he manifests an acute and enlightened understanding in the exposition of certain doctrines, and in the philosophical principles which he assumes. As a proof, he resists his inclination for the Arabic-Aristotelian system so far as to call in question many of its hypothesis, e. g. that of the Intelligences of the spheres, and of the Active Universal Intelligence.

It may be observed, that during the twelfth and thirteenth centuries, the Jews acted as interpreters between the Saracens and the Western nations, by their frequent translations into Hebrew of the works of the Arabians;

<sup>m</sup> AVERROES in Metaph. lib. XII, c. 18. MOSES MAIMONIDES *More Nevochim*, lib. I, c. 71, p. 133—135.

<sup>n</sup> Rabbi Moses Ben Maimon.

<sup>o</sup> Translated into Latin by J. BUXTORF, Basil. 1629, 4to.

which were re-translated from the Hebrew, (a language then better known than the Arabic), into Latin; very imperfectly indeed, but pretty generally.

260. The consequence of this dissemination of the Aristotelian philosophy from an Arabian source, was the increased reputation of that philosopher, who was in a manner installed the sovereign and infallible arbiter of truth and falsehood in all matters of science. The circle of the sciences and the field of inquiry was enlarged, new ideas and new combinations were developed to the advantage of Dialectics, the exercise of which they called forth. Philosophy came to be less and less confounded with the sciences, and was allowed to retain a place distinct from them. One of the principal co-operating causes was the formation of the University of Paris, and of similar institutions in other cities. Out of this arose a sort of polemical contest between Theology and Philosophy, in which the former obtained the ascendancy; the latter being depressed to an inferior position, and a distinction established between Theological and Philosophical truths. To this succeeded an attempt to reconcile and associate the two, which was for some time successful.

*Alexander of Hales and his Contemporaries.*

261. The first author who turned to account the works of the Arabians was *Alexander of Hales* (*Alesius*), so called from a convent in Gloucestershire, and surnamed *Doctor Irrefragabilis*. Tiedemann makes him the first Schoolman. He taught Theology at Paris, and in his *Summa Theologiæ*<sup>o</sup> enlarged upon the Manual of Lombardus, (§ 251), by a rigorous syllogistical statement of the different opinions contained in his book. *William of Auvergne*<sup>p</sup> devoted himself to the statement

<sup>o</sup> Ven. 1475, fol. Norimb. 1481. Ven. 1576, 4 vols. fol.

<sup>p</sup> Guillelmus Arvernus, and Parisiensis, because bishop of Paris, died 1249. Opera, Ven. 1591, fol. Aurel. 1674, 2 vols. fol.

and discussion of philosophical questions respecting Morals and Metaphysics, with less general views. *Vincent of Beauvais*<sup>9</sup>, in his books of reference (*Specula*), gave a picture of the state of the Sciences at this period, particularly of moral philosophy, and has enlightened us with respect to the discordant opinions of the Nominalists and Realists. *Michael Scott* (was living at Toledo A. D. 1217) translated the works of Aristotle, *De Cælo et de Mundo*, and *De Animâ*, as well as the *Historia Naturalis*; according to the Arabian arrangement: a labour in which he was assisted by a Jew named Andrew. He commented on Aristotle, and availed himself of his Logic. *Robert Grosseteste*, or *Greathead*, (*Robertus Capito*), who taught at Paris and Oxford, and died bishop of Lincoln A. D. 1253, besides other treatises composed some Commentaries on Aristotle.

### *Albert the Great.*

Rudolphus Noviomagensis de Vitâ Alberti M. libb. III, *Colon.* 1499, et: Alberti M. Opera ed. PET. JAMMY, *Lyon.* 1651, 21 vols. fol.

262. *Albert of Bollstädt*, or *the Great*, was the first who gave a decided direction to the general tendency in favour of the Aristotelian system. He was born at Lauingen in Swabia, A. D. 1193 or 1205, and studied at Pavia, where he entered the order of the Dominicans, and by his great application to study, especially to that of Natural History, (a department then very generally neglected), he acquired so great a mass of information that he came to be looked upon as a prodigy, and a sort of enchanter. He lived principally at Cologne and Paris: in 1260 was made bishop of Ratisbon, but subsequently resigned that dignity, in order to devote himself

<sup>9</sup> Bellovacensis, died about 1264. *Speculum Universale*, *Argent.* 1473, fol. *Speculum quadruplex Opera et stud. Theologor. Bened. Duaci*, 1624, 4 vols. fol. See Vincent de Beauvais, etc., by FR. CRRH. SCHLOSSER, *Francf. a. M.* 1819, 2 vols. 8vo.

to study. He died in his convent at Cologne 1280. He was rather a learned man and a compiler of the works of others, than an original and profound thinker. He wrote commentaries on most of the works of Aristotle, in which he makes especial use of the Arabian commentators, and blends the notions of the Neoplatonists with those of his author. Logic, Metaphysics, Theology, and Ethics, were rather externally cultivated by his labours than effectually improved. With him began those minute and tedious inquiries and disputes respecting Matter and Form, Essence and Being (*Essentia* or *Quidditas* and *Existentia*, whence subsequently arose the farther distinction of *Esse Essentiæ*, and *Existentiæ*). Rational Physiology and Theology are indebted to him for many excellent hints. The latter science he treated in his *Summa Theologia*, as well according to the plan of Lombardus as his own. He described the soul as a *totum potestativum*, and asserted that General Ideas belonged partly to the mind, partly to external objects. In his Theology he laboured to define our rational knowledge of the Nature of God, (excluding from such inquiries the mystery of the Trinity), and enlarged upon the metaphysical idea of Him, as a necessary Being, (in whom Essence and Being are identical), endeavouring to develop in this manner His attributes. These inquiries are often mixed up with idle questions and dialectic absurdities, and involve abundant inconsistencies; as for instance, when he would account for the creation by the doctrine of Emanation, (*causatio univoca*), and nevertheless denies the Emanation of souls:—he insists upon the universal intervention of the Deity in the course of Nature, and yet asserts the existence of natural causes, defining and limiting His operations. He considered Conscience to be the highest law of Reason. All virtue which is acceptable to God is infused by Him into the hearts of men. His scholars were distinguished by the name of Albertists.

*Bonaventura.*

† Abridged History of the Life, Virtues, and Religious System of St. Bonaventura, etc. *Lyon*, 1749, 8vo. and: Bonaventuræ Opera, *Argent.* 1482, fol. Idem: Jussu Pii V, *Romæ.* 1588-96, 7 vols. fol. (best edition).

263. The contemporary of Albert, *John of Fidanza* or *Bonaventura*<sup>a</sup>, surnamed *Doctor Seraphicus*; was possessed of less extensive learning than the other, but of more talent; and a pious frame of mind, tintured with mysticism. It was his endeavour to reconcile the views of Aristotle and the Alexandrians. In his commentary on Lombardus<sup>t</sup> he contracts the sphere of speculation, and studies to employ the principles of Aristotle and the Arabians, not so much for the satisfaction of a minute and idle curiosity, as for the resolution of important questions, and to reconcile opposite opinions; especially in the important inquiries respecting Individuality and Free-will. Occasionally he rests his arguments rather on the testimony of human experience than that of theory: for instance, respecting the doctrine of the Immortality of the Soul. The Supreme Good he affirms to be Union with the Deity; by which alone mankind can attain a perception of Truth, and the enjoyment of happiness. This leads him to ascribe<sup>u</sup> all knowledge to Illumination from on high; which he distinguishes into four species: Exterior—Inferior—Interior—and Superior. He defines also<sup>x</sup> six degrees whereby man may approximate the Deity; and refers to these six as many distinct faculties of the Soul: an ingenious idea and copiously detailed, but in a great degree arbitrary and forced.

Finding speculation insufficient for the ideal attainment of the Supreme Good, he abandoned himself with all his heart to mysticism.

<sup>a</sup> Born at Bagnarea 1221, died 1274.

264. Nearly at the same time with Bonaventura, St. Thomas Aquinas (or *ab Aquino*), obtained a celebrity which eclipsed that of almost every writer of his age. He was born A. D. 1224, in the castle of Rocea Sicca in the kingdom of Naples, of a great feudal family; and in opposition to the wishes of his parents, was determined by his ardent love for study to enter the order of the Dominicans, (1243). The same attachment to letters carried him to Paris, and to Cologne, to profit by the lessons of Albertus, and caused him to decline all offers of advancement in his order, beyond that of *Definitor*; while it procured him the reputation of the greatest Christian philosopher of his century, and the appellations of *Doctor Universalis* and *Angelicus*. He died 1274, and, as well as Bonaventura, was canonised. Thomas Aquinas was endowed with a genius truly philosophical; had amassed

great knowledge; and cherished an ardent zeal for the advancement of rational knowledge. He rendered real service to the Aristotelian philosophy by the pains he took to effect a translation of the works in which it was contained, and by his commentaries on them. He was a Realist<sup>†</sup>, and considered the abstract idea of things to be their original essence. This system he endeavoured to place on a firmer basis by extending the theory of Thought propounded by Aristotle, to which he superadded somewhat of the system of Plato and of the Alexandrians. With this is connected his explanation of the ideas of Matter and Form, as Elements of compound objects. The intellectual Soul, the nature of which he discusses after Aristotle's system, is the Substantial *Form* of man, immaterial and indestructible. But his meditations were principally devoted to the study of Theology, which he endeavoured to reduce to a systematical form by enlarging upon its principles in the manner of the Aristotelian and Alexandrian Schools. Such was the design of his Commentary on Lombardus, of his work Against the Heathens<sup>‡</sup>, and of his *Summa Theologiæ*. The latter is the first attempt at a complete system of Theology comprehending one of Ethics, and is enriched with many solid and wise observations, without the observance of any rigorous order in its details. Its principles are not laid down with sufficient precision, and the different sources of information are not clearly distinguished. He taught that Evil, or the negation of Good is necessary to the completion of the Universal system, and that God is only the accidental cause of it. We may observe in this system (as well as in St. Augustine, from whom he derived them), many of the principal features of that of Leibnitz respecting the Divine Government. He treats the subject of Morals, which he divides into General and Special, in part according to the views of The-

<sup>†</sup> The terms Realist and Idealist may, in this treatise be considered synonymous: both are opposed to Nominalist, and signify a believer in the reality of Generic and Specific Ideas.

<sup>‡</sup> *Summa Catholicæ Fidei adversus Gentiles*, Burdig. 1664, 8vo.

ology, and partly after those of Aristotle: and although his ideas are not very clearly defined or largely developed, that science is much indebted to his labours. He continued to be for a long time the highest authority in matters of Religion and Philosophy, and had a large number of disciples, (especially among the Dominicans and Jesuits), who called themselves by his name. Among these we remark *Ægidius Colonna*, a Roman, *Hervæus* (§ 267), *Thomas de Vio Cajetanus*, *Gabr. Velasquez*, *Petrus Hier-tadus de Mendoza*, *P. Fonseca*, *Domenic of Flanders* (died 1500), and *Fr. Suarez* (died 1617).

### *Contemporaries of Thomas Aquinas.*

265. Other contemporaries of Thomas deserve to be briefly mentioned; for instance, *Petrus Hispanus*, of Lisbon, afterwards pope, under the style of John XXI, and who died 1277. He distinguished himself by his *Summulæ Logicales*, an abridgment of the Scholastic Logic: and it is to him we probably owe the ingenious arrangement of the different forms of argument, so often republished<sup>a</sup>. To him must be added *H. Goethals* of Muda, near Ghent, better known under the name of *Henricus Gandavensis*, surnamed *Doctor Solemnis*, who became a professor at Paris, and died archdeacon of Tournay, 1293<sup>b</sup>. He was endowed with great sagacity of understanding, attached to the system of the Realists, and blended the Ideas of Plato with the formularies of Aristotle: attributing to the first a real existence, independent of the Divine Intelligence. He suggested some new opinions in Psychology, and detected many speculative errors, without however suggesting corrections of them, owing to the faultiness of the method of the Philosophy of his time. He frequently opposed Thomas

Aquinas himself. To these we may add *Richard de Middleton*, (*Richardus de Mediâ Villâ*), surnamed *Doctor Solidus, Fundatissimus*, and *Copiosus*, who died a professor at Oxford, A. D. 1300, and was a skilful interpreter of Lombardus.

266. *John Duns Scotus*, born at Dunston in Northumberland (about 1275 ?), became a Franciscan, and was sur-

order. He had the perspicacity to detect the false principles of the philosophical system of his time, and instead of the frivolous distinctions then established, was desirous of opening new paths to inquiry through the study of Nature and the Languages. Unfortunately the monkish spirit of the time repressed his investigations, and the influence they would have insured to him. He taught at Oxford A. D. 1240, and died 1292 or 1294<sup>s</sup>. *Raymond Lulli* (*Lullus*, or *Lullius*, born at Palma in the isle of Majorca 1234), was distinguished in his mature days for a devout piety, as he had been notorious in his youth for his love of pleasure. He devoted himself to the conversion of the Mahometans and Pagans; pretending to have received to this intent illumination from above, and the gift of the Great Art (*Ars Magna*<sup>h</sup>). His endeavours not being as successful as he had hoped, he devoted this Great Art to the reformation of Philosophy and the Sciences. His art was nothing more than a Mechanical Logic, calculated to solve all questions without any study or reflection on the part of him who should use it. He added thereto some hints borrowed from the philosophy of the Arabians and the Cabbala, which he appears to have been the first Christian author to cultivate. In his numerous works and those of his School we frequently discover more clear and elevated views of Morality, though he was not able to escape canonical censure on this head. He died 1315. His followers (*Lullists*), disseminated a superstitious enthusiasm, together with the belief he entertained in the possibility of making gold; but occasionally struck out new and valuable ideas. Long

He obtained the appellation of *Doctor Illuminatissimus*.

after his death the *Ars Magna* of Raymond Lulli found admirers among men of talent, (e. g. Giordano Bruno).

At this period also appeared *Petrus ab Apono* (or *Abano*), near Padua, born 1250, died 1315 or 1316; a physician, attached to the Arabian doctrines, and author of a book entitled, *Conciliator Differentiarum Philosophicarum et Præcipue Medicorum*<sup>1</sup>:—and *Arnold de Villanova*, who died in 1312, a zealous fellow-labourer with the former, and inclined to the opinions of Raymond Lulli<sup>2</sup>.

#### FOURTH PERIOD OF THE SCHOLASTIC DOCTRINE.

III. *Disputes between the Nominalists and Realists renewed by Occam, in which the former gain ground. (From the Fourteenth Century to the end of the Fifteenth.)*

270. About the close of this century a man of great merit contributed much to the downfall of Realism, and the cessation of these endless logical disputes, by resolving difficulties after a clearer and more precise manner, and establishing the foundations of a more exact knowledge of properties of the Object and Subject. This was *G. Durand de St. Pourçain*<sup>1</sup>. He was at first a Thomist, but subsequently became a candid adversary of that School<sup>m</sup>.

271. *William of Occam* (or *Ockham*), an Englishman, born in Surrey, and surnamed *Doctor Singularis, Invincibilis et Venerabilis Inceptor*, a disciple of Scot, and, like him, a Franciscan; began a new era in philosophy and history by his talents, and the courage with which he opposed himself most zealously to the despotism of the prevailing dogmata. He was a teacher at Paris at the beginning of the fourteenth century, and having defended the rights of the king of France and the emperor against the usurpations of the Pope, died, persecuted but not subdued, at Munich in 1347 or 1343. He proposed to effect no more by his Logic than a better demonstration of common opinions; refused to submit implicitly to authority; and closely following the principles of more rational Dialectics, and in particular the dictum that—*Entia non sunt multiplicanda præter necessitatem*: he demonstrated the absurdity of Realism; refuted it in a variety of particulars, and directed the attention of others to the doctrine of the Nominalists. He denied that Ideas had any other real existence than what they possess in the understanding, by which they are contemplated; because such an hypothesis is not necessary either for the purposes of science or philosophy, and because it leads to extravagant consequences: on the contrary, such Ideas are the *figmenta* of the mind itself by the process of Abstraction, which it employs to designate classes of external objects<sup>n</sup>. He did but *sketch* the principles of a philosophy afterwards completed; but his labours sufficed to withdraw the attention of his followers from the all-engrossing question of the principle of *Individuality*, and directed them rather to the acquirement of fresh knowledge. In his theory of knowledge, Occam receded still farther from the opinions of the Realists, and by maintaining that Thought was Subjective, afforded a greater handle to Scepticism and Empiricism than possibly he himself might have intended. Though too absolutely laid down, such a proposition, was, nevertheless,

<sup>n</sup> Comment. in Lib. I, 2, Quest. 4 and 8.

in the circumstances of the times, serviceable to the cause of philosophy. William of Occam, by controverting established Dogmata, by his Scepticism, and by the new ideas he started, impaired the authority of existing principles, and gave occasion to more extended inquiries. On the same ground, he endeavoured, in Theology, to circumscribe the subjects of investigation, and rejected the established Scholastic proofs of the Existence, Unity, and Omnipotence of the Divinity; as also of His Wisdom; asserting that all these are to be derived from Religion alone. Nevertheless, he departed so far from his own principles as to offer a proof of the existence of God, derived from the preservation of all things in their original state; asserting that for such preservation some active efficient cause must be assigned, which can be no other than the First Creative Principle. With respect to the possibility of forming an adequate idea of God, he offers many excellent observations, but not altogether conclusive. In Psychology he threw out some ingenious notions respecting the Soul, the diversity of its faculties, and their relations to their objects. He refuted at length the hypothesis of Objective Images (Species); up to this time regarded as necessary to a theory of Perception and Thought. On many points Occam adhered to the opinions of his master, Scotus; for instance, respecting Free-will, and the origin of Moral distinctions in the Will of God.

### *Opponents of Nominalism.*

272. Occam in his turn was opposed by the partisans of Realism, though in a much more feeble manner, and among others by his fellow-student *Walter Burleigh*<sup>p</sup>, *Burlæus* (*Doctor Planus et Perspicuus*), born 1275; at first a professor in England, then at Paris, and lastly at Oxford, and who died about 1337. The debates between

<sup>p</sup> He composed Commentaries on Aristotle and a Biography of the Philosophers: *De Vitâ et Moribus Philosophorum et Poetarum*, Colon. 1427, 4to. Nuremb. 1777, reprinted. See HEUMANN, *Acta Philos.*, No. 14, p. 282, sqq.

the two schools appear now to have been mainly confined to oral disputation. With regard to the writings of *Thomas de Bradwardine*<sup>q</sup>, and *Thomas de Strasburg*<sup>r</sup>, we need only remark that the former resisted the tendency to Pelagianism contained in the theory of Scotus, and the second did but reproduce what had been already taught by Ægidius Colonna. *Marsilius of Inghen*<sup>s</sup> appears to have been a moderate Realist, according to the principles of Occam and Scotus, as respected the theory of Volition.

### *Nominalists.*

273. The most celebrated Nominalists who succeeded, were *John Buridan* and *Peter D'Ailly*. John Buridan of Bethune, professor of philosophy and theology at Paris<sup>t</sup>, was looked upon by his contemporaries as one of the most powerful adversaries of Realism, and distinguished himself also by his rules for finding the Middle Term in Logic; a species of contrivance denominated by some the *Ass's Bridge*; as well as by his inquiries concerning Free-will, wherein he approached the principles of Determinatism<sup>u</sup>, maintaining that we necessarily prefer the greater of two goods. As for the celebrated Illustration, which bears his name, of an Ass dying for hunger between two bundles of hay, it is not to be found in his writings.

<sup>q</sup> Of Hertfield; died archbishop of Canterbury 1339. Wrote *De Causâ Dei contra Pelagium et de Virtute Causarum* lib. III, ed. HENR. SAVILE, *Lond.* 1618, fol. Thomas de Bradwardine was also celebrated for his Mathematical works.

<sup>r</sup> Thomas Argentinensis, died prior-general of the order of the Hermits of St. Augustine, A. D. 1357: composed *Comment. in Magistr. Sententiarum*, *Argent.* 1490, fol.

<sup>s</sup> Surnamed *Ingenuus*: He taught at Paris and Heidelberg, which latter university he helped to form. Died 1396. He composed *Commentt. in IV libb. Sententiarum*, *Hagen*, 1497, fol.

DAN. LUD. WUNDT, *Commentatio Historica de Marsilio ab Inghen, primo Universitatis Heidelberg. Rectore et Professore*, *Heidelb.* 1775, 8vo. The same, in the *Thesaurus Biog. et Bibliographicus* of WALDAU.

<sup>t</sup> In the year 1358 he was still living at Paris.

<sup>u</sup> See his *Quæstiones* in X libb. *Ethicorum Aristot.* *Paris*, 1489, fol.; *Orf.* 1637, 4to. *Quæst. in Polit. Arist. ibid.* 1500, fol.; *Compendium Logicæ*, *Ven.* 1499, fol. *Summula de Dialecticâ*, *Paris*, 1487, fol. See BAYLE'S *Dict.*

*Peter D'Ailly*, a cardinal (died 1425)<sup>a</sup>, assisted to mark still more broadly the limits between Theology and Philosophy, and opposed the abuses of the Scholastic system. His opinions respecting the degree of certainty belonging to human knowledge, and his examination of the proofs advanced of the existence and unity of God deserve particular attention<sup>y</sup>. The other partisans and supporters of Nominalism were *Robert Holcot*, an Englishman (died 1349), *Gregory of Rimini*<sup>a</sup>, *Richard Suisset* (or *Swinshead*), an Englishman and a Cistercian monk (taught at Oxford about 1350), *Henry of Oyta*, and *Henry of Hesse*<sup>a</sup>, *Nicolas Oramus*<sup>b</sup>, *Matthew of Cracow*<sup>c</sup>, and *Gabriel Biel*, who died 1495, and was the author of a brief and luminous exposition of the principles of Occam<sup>d</sup>. Almost all were celebrated as professors, and men of cultivated parts, but without any true philosophical talent, though *Henry of Hesse* distinguished himself by some discoveries in Mathematics and Astronomy.

274. Up to this time the disputes between the two sects continued to be pursued with the like animosity, and with equal admixture on both sides of human passions. Though Nominalism had been proscribed at Paris<sup>e</sup>, it nevertheless made good its ground, and even

<sup>a</sup> Peter de Alliaco, styled *Aquila Gallia*, born 1350 at Compiègne: chancellor of the university of Paris, 1389, bishop of Puy and Cambrai, and finally a cardinal.

<sup>y</sup> Petri de Alliaco Cardinalis Cameracensis Vita, by DUPIN, in 1st vol. of Opp. GERSONI, p. 37.

<sup>b</sup> Or Oresmius, died bishop of Lisieux, 1382.

<sup>c</sup> Or Chrochove, in Pomerania, died 1410.

<sup>d</sup> Born at Spires, provost of Aurach, and professor of theology and philosophy at Tübingen.

Epitome et Collectarium super IV libb. Sententiar. Tub. 1495, 2 vols. fol.: Epitome Scripti Guil. Occam Circa duos Priores Sententiarum.

HIERON. WIEGAND BIEL, Diss. (præs. GOTTLIEB WERNSDORF) de GAB. BIEL celeberrimo Papista Antipapista, Viteb. 1719, 4to.

<sup>e</sup> In 1339, 1040, 1409, 1473.

gained from day to day fresh adherents; nay, it more than once obtained, even at Paris, as well as in the universities of Germany, the pre-eminence, but without completely defeating the opposite party. The same scenes were perpetually acting on both these theatres of contention: the nature of Ideas not being the only point of dispute, but combined with a complete diversity of opinions in general. On the part of the Nominalists might be noticed the gradual increase of a spirit of independence, and a tendency to more liberal principles, though asserted by very imperfect philosophical Methods. This spirit especially manifested itself in opposition to the theses of the Idealist *Nicolas of Autricuria* (bachelor of Theology at Paris, 1348), and of *John de Mercuria* (about the same year<sup>f</sup>), yet eventually proved abortive, and the customary opinions of the age resumed their sway.

275. The ultimate consequence of these repeated discussions was a diminution of the credit and influence of the Scholastic system, and at the same time a diminished regard for philosophy, especially for Logic, of which in his time Gerson already saw reason to complain; and this induced a disposition to Mysticism, arising out of a feeling of disgust for unmeaning verbal disputes. Mysticism was accordingly preached with ardour by *John Tauler*, who died at Strasburg 1361, and more especially by the celebrated *John Charlier de Gerson* of Rheims, born 1363, the disciple of Peter D'Ailly, and his successor as chancellor of Paris, in 1395; died almost in exile in 1429, at Lyon. He devoted his principal attention to discussing the obligations of Practical Christianity, which procured for him the appellation of *Doctor Christianissimus*; and reduced all philosophy to a mystical doctrine which he founded entirely on the occult impressions of Inspiration<sup>g</sup>. He nevertheless opposed himself to enthusiastic extravagancies, retaining the use of Logic,

<sup>f</sup> See BOULAY, Hist. Univ. Paris, tom. IV, p. 308, sqq.

<sup>g</sup> De Mysticâ. Theol. Consideratt. II.

and employing it after a new method<sup>h</sup>. Next to him we must place *Nicolas de Clemange* (*de Clemangis*), a courageous thinker; who opposed the narrow subtilties of the Schools<sup>i</sup>. He was rector of the university of Paris (1393), and died about 1440. But the man who, as a religious writer, possessed the greatest influence in his own and succeeding ages was *Thomas Hamerken* (*Malleolus*), styled *Thomas à Kempis*<sup>k</sup>, from the name of a village, Kempen, in the archbishopric of Cologne, where he was born A. D. 1380. He died 1471. Another eminent mystic\* was *John Wessel*, surnamed Gansford, or Gøesevôt (Goose-foot)<sup>l</sup>, styled by his contemporary admirers *Lux mundi et magister contradictionum*. He was at first a Nominalist, and an opponent of the dogmatism of the Schoolmen. The same dislike of the same system may be observed in the Natural Theology of *Raymond de Sabonde* (or *Sebunde*), who taught at Toulouse in the first half of the fifteenth century, about 1436. He asserted that man has received from the Almighty two books, wherein he may discover the important facts which concern his relation to his Creator,—namely, the book of Revelation and that of Nature: the latter he affirmed to be the most universal in its contents, and the most perspicuous. He endeavoured by specious rather than solid arguments to deduce the theology of his age, even in its more peculiar doctrines, from the

\* [The terms *Mystic* and *Mysticism* are used in the present work in a somewhat restricted and peculiar sense. Transl.]

<sup>l</sup> Born at Gröningen, 1409; died 1489. He must not be confounded with his contemporary, the Nominalist, *John Burchard von Wessel*. See GÖTZE, Comment. de J. Wesselo, Lut. 1719, 4to. J. Wessellii Opera, ed. LYDIUS, Amst. 1717, 4to.

contemplation of Nature and of Man. His attempt deserved, for its just observations on many subjects, especially on Morals, greater success than it met with; until Montaigne directed to it the attention of his contemporaries<sup>m</sup>.

*Observation.* It cannot be expected that a minute account should have been rendered of the respective opinions, in detail, of each Schoolman; involved as they are in endless disputes and distinctions respecting the same subjects:—Such a specification, if it had been possible, would, in an abridgment like the present, have been superfluous. The Sentences of Lombardus and the works of Aristotle were the constant subjects of their discussions from the time of Albert the Great; respecting which their commentaries and disquisitions were as minute as they were voluminous and unprofitable.

<sup>m</sup> Montaigne has translated, under the title of Natural Theology, his *Liber Creaturarum sive Naturæ*. The Latin editions are *Francof.* 1635, and *Amstel.* 1761. See Montaigne's Observations in his *Essays*, L. II, c. 12.

## PART THE THIRD.

### THIRD PERIOD.

---

#### MODERN PHILOSOPHY.

THE SCHOLASTIC SYSTEM OPPOSED BY A RETURN TO, AND BY NEW COMBINATIONS OF, FORMER SYSTEMS PHILOSOPHY.

*From the Fifteenth Century to the end of the Sixteenth.*

276. The exclusive system we have been considering which, grounded in authority, pretended to establish a philosophy maintained by logical definitions and combinations, contained within itself the elements of its own destruction. The disputes of the two adverse sects into which its supporters were subdivided, gradually loosened its hold on the public mind, and the Nominalists in the end openly attacked its authority; so that men became more and more awakened to the necessity (though as yet imperfectly understood), of consolidating Science, and strengthening its foundations, by a more accurate and renewed observation of Nature, and by increased study of the Languages. The party of the Mystics especially, animated as they were by a more profound sentiment of zeal, religious and moral, were dissatisfied with the meagre and pedantic forms, which were as yet their only support. Nevertheless it was from another quarter that the revolution was destined to commence.

277. The human mind had too long lost the true path of Science, to be able immediately to recover it. In consequence of its long subjection to prescriptive ideas,

we find that it continued for some time to labour to unravel the consequences of those it had inherited, rather than apply itself to the legitimate objects of inquiry—the principles of Knowledge, and of its own operations. From want of skill to detect the concatenation of different branches of knowledge, and from the habit of confounding notions derived from very different sources, the human mind was unable to discover the faultiness of its own method, and the influence of the old system was necessarily prolonged. Other circumstances contributed to the same result: the inveterate reverence for Aristotle's authority—the want of real and accurate knowledge—the bad Taste of the age, and the low state of Classical learning—added to the redoubtable authority of the Papal Hierarchy, and the jealous zeal with which the guardians of the ancient Dogmatism protected their errors ;—all these auxiliary circumstances long continued to make it difficult to shake off the intolerable yoke, against which some bolder spirits had already begun to rebel.

278. Nevertheless certain political events in Europe gradually prepared the way, though at first distantly, for a complete change in its civil and ecclesiastical constitution,—shook the supports of the old philosophy; and, by ultimately destroying it, helped to produce a revolution in the literary world, rich in important consequences. These were: The Crusades—The Invention of Printing—The Conquest of Constantinople—The discovery of the New World—and the Reformation; with the direct or indirect results of these events; such as the formation of a Middle Class of citizens—the influence acquired by public opinion—the increase of the Temporal at the expense of the Spiritual Power—the consolidation of civil authority on firmer and better-established bases—the advancement of experimental knowledge and the sciences—the acquisition of models for imitation and sources of instruction in the recovery of the authors of antiquity—and, lastly, the improvement and cultivation of the languages of Modern Europe. The human mind became sensible of its need of

instruction and of the imperfection of its present systems, and demanded a better philosophy; but, too weak as yet to support itself without such assistance, it leaned upon the authors of antiquity for guidance and support. The cultivation of this study brought with it an improved spirit of refinement and moral improvement, and at the same time showed by reflection the evils of that state of mental subjugation to which so many centuries of mankind had been reduced, and awakened in those who prosecuted it a desire to liberate themselves from such thralldom.

279. At the same time that these circumstances from without operated, or contributed to operate, so great a change in the fortunes of Philosophy, a strong disposition prevailed among many to derive all true knowledge and wisdom from no other source but Revelation; and, consequently, to the devout study of the Bible was added also a Cabbalistical spirit of inquiry, which appears to have been derived by the Fathers from the Jews; and which was in part kept alive and recommended by the constant disputes and uncertainties of a vast number of contending sects, into which the Philosophical world was soon divided.

280. The consequence of all these different causes was that a variety of systems of greater or less validity began to prevail; knowledge was cultivated and improved;—the limited horizon, which before bounded the views of all, was enlarged: some of the Grecian systems of philosophy were cultivated and adopted; discussions were set on foot with regard to their respective merits, and the attempt was made to combine them (either partially or entirely); and to reconcile them with Christianity. The systems themselves were consequently submitted to examination, attempts were made to extend the dominion of Science, more especially in the department of Natural History (as yet so imperfectly cultivated), though accompanied with a thirst for occult and mysterious science.

Lastly came the desire to combine in one system not only Theology and Philosophy, but in like manner to unite the Intellectual and Experimental theories;—the doctrines of Plato and those of Aristotle.

*Revival of Greek literature in Italy: with its immediate consequences.*

281. When the Greeks, who had always retained a certain degree of attachment for letters, derived from their renowned ancestors, (§ 253), came to solicit in Italy assistance against the Turks; and, after the capture of Constantinople, sought there a safer residence than in their own country, they brought with them a rich fund of various arts and literary treasures, and infused a new energy into the minds of the Western nations, who were already in a state to profit by such acquisitions<sup>a</sup>. Among these precious remains of Ancient Greece were the works of Aristotle and Plato in their original form: the knowledge of which was presently disseminated through Europe with remarkable celerity. The Greeks who respectively supported the two systems of those great philosophers, (such as *George Gemisthus Pletho*<sup>b</sup>,

<sup>a</sup> To this age belong the poets *Dante Alighieri*, *Petrarca*, and *Boccaccio*, who contributed much to the general diffusion of a literary taste, though not immediately and directly to that of philosophy.

For the learned Greeks who were instrumental in bringing about this revival of Classical literature, (*Emmanuel Chrysoloras*, *Th. Gaza*, *George of Trebizond*, *John Argyropulus*, etc.), see HUMPHR. HODIUS, *De Græcis illustribus Linguae Gr. Literarumque Humaniorum restauratoribus*, Lond. 1742, 8vo. HEEREN, *Hist. of the Study of Class. Lit.* CHPH. FR. BÖRNER, *De Doctis Hominibus Græcis Literarum Græcarum in Italia restauratoribus*, Lips. 1750, 8vo. CHPH. MEINERS, *Biography of celebrated Men*.

<sup>b</sup> Of Constantinople: came to Florence 1438.

GEO. GEMISTHI PLETHONIS, *De Platonicae atque Aristotelicae Philosophiae Differentiâ*, Gr., Ven. 1540, 4to.

Among his Philosophical Works: was

*Libellus de Fato*, ejusd. et Bessarionis Epist. Amœbææ de eod. Argumento cum Vers. Lat. H. S. REIMARI, *Lugd. Bat.* 1722, 8vo. *De IV Virtutib. Cardinalib.* Gr. et Lat. ADR. OCCONE interprete, Bas. 1522, 8vo., et al. *De Virtutibus et Vitiis*, Gr. Lat. ed. ED. FAWCONER, Oxon. 1752, 8vo. See FABRIC. *Bibl. Gr.* tom. X, p. 741.

on the one side, a partisan of the Neoplatonic doctrine; and on the other *George Scholarius*, subsequently called *Gennadius*, *Theodore Gaza*<sup>c</sup>, and more especially *George of Trebison*<sup>d</sup>, all Aristotelians), engaged in a warm dispute respecting the merits of their favourite systems<sup>e</sup>, which it required all the moderation of cardinal Bessarion<sup>f</sup> in any degree to temper.

*Attack on the Scholastic System.*

282. The first result of all these circumstances was a conflict with the Scholastic system, which, besides the inherent causes of its barbarous style, bad taste, and narrow views, was occasioned also by the recent discovery of the great difference between the Aristotelian theory as taught in the Schools, and the same as it was discovered to exist in the writings of Aristotle himself. The philologists *Hermolaus Barbarus*<sup>g</sup>, the translator of Aristotle, of Themistius, and Dioscorides, and *Angelus Politianus*<sup>h</sup>, were the first to enter the lists with its champions: *Laurentius Valla*<sup>i</sup>, and *Rodolph Agricola*<sup>k</sup> the German, en-

<sup>c</sup> Came into Italy about 1430; died about 1478. He was born at Thessalonica.

<sup>d</sup> Born 1395, in the isle of Crete; professor of Greek literature in various places in Italy; died 1484 or 86.

Besides several commentaries, he wrote the dissertation styled, *Comparatio Aristotelis et Platonis*, Ven. 1523, 8vo.

<sup>e</sup> On this subject see a Dissert. of BOIVIN in the Mem. of the Acad. of Inscript., tom. II, p. 775, sqq.

See his work: *In Calumniatorem Platonis libb. IV*, Ven. 1503 et 1516, directed against the Aristotelians. *Ejusd. : Epist. ad Mich. Apostolicum de Præstantiâ Platonis præ Aristotele*, etc., Gr. c. vers. Lat. Mem. de l'Acad. des Inscript., tom. III, p. 303.

<sup>f</sup> Born in 1395, at Trebison, came to Florence in 1438, died in 1472.

<sup>g</sup> Hermolao Barbaro, of Venice; born 1454, died 1493.

<sup>h</sup> Properly Angelo Ambrogini, or Cino; surnamed *Poliziano*: born at Monte Pulciano 1454; died 1494.

<sup>i</sup> Lorenzo Valla of Rome; born 1408, died 1457.

*Laurentii Vallæ Opera*, Basil. 1543, fol. *De Dialecticâ contra Aristoteles*. Venet. 1499, fol. *De Voluptate et Vero Bono libb. III*, Basil. 1519, 4to. *De Libero Arbitrio*, *ibid.* 1518, 4to.

<sup>k</sup> Rudolph Husmann or Hausmann; born at Bafflen, near Gröningen, 1443, died 1485.

deavoured, by removing the rubbish with which the field of Dialectics was encumbered, to render them more available for useful purposes: then succeeded *H. Cornelius Agrippa of Nettesheim* (see § 287), *Ulrich von Hutten*<sup>1</sup>, *Erasmus*<sup>m</sup>, and his friend *J. L. Vives*<sup>n</sup>, *Philip Melancthon* (§ 292), *Jacobus Faber*<sup>o</sup>, *Marius Nizolius*<sup>p</sup>, *Jac. Sadoletus*<sup>q</sup>, and *Jac. Acontius*<sup>r</sup>. The methods pursued by these learned men in their attacks on the system of the Schools were very dissimilar, according to the different lights in which they viewed that system, and the different objects which engrossed their attention.

### *Renewal of the Ancient Systems.*

283. In consequence of these pursuits the systems of the Grecian and Arabian philosophers were brought into discussion, and the opposition to the Scholastic system reinforced. The doctrines of Aristotle and Plato were the first which thus regained their place; (the sort of knowledge then cultivated favouring their reception); and, sub-

sequently, other theories allied to theirs. In this manner the Cabbalistic and Theological systems were mixed up with the theories of the Platonists; and the Ionian and Atomistic doctrines with the Aristotelian. The Stoic and Sceptic systems at first had few defenders: nevertheless, as it is impossible that any of the ancient theories should give entire satisfaction in an age so different from that in which they first appeared, and as their defects were of course gradually brought to light, it followed that attempts were occasionally made to *combine* different views, while at other times they were separately attacked with Sceptical objections. In their choice of a sect, and their efforts to establish or destroy a theory, men were influenced by two sets of considerations; according as they proposed to themselves to establish a Theological system, or to promote discoveries in Natural Science.

### I. *Revival of Platonism: The Cabbalistical, Magical, and Religious Philosophies.*

Besides the works mentioned § 282, see the Sketch of the History of Philosophy by BUHLE.

LUDW. DANKEGOTT CRAMER, Diss. de Causis Instauratæ Sæc. XV, in Italiâ Philosophiæ Platoniciæ, *Viteb.* 1812, 4to.

284. The Platonic philosophy which was eagerly received in Italy by men of fanciful minds was fostered at Florence by the two Medici, Cosmo and Lorenzo<sup>a</sup>, and excited there a vivid enthusiasm; though wearing rather the character of the Neoplatonic school than of the Academy. Among the recommendations it possessed in their eyes was one which in fact was purely gratuitous, viz. that it was derived, as some of the Fathers believed, from the Jewish philosophy and religion; and hence its reputation of being allied to Christianity<sup>b</sup>. A similar preju-

<sup>a</sup> WILL. ROSCOP, *The Life of Lorenzo de' Medici*, *Liverp.* 1795, 2 vols. 4to.

<sup>b</sup> JON. PICI Heptaplus, p. 1, *Franc.* PICI Epist. lib. IV, p. 882.

dice caused them to connect with Platonism the Cabbalistical and Mosaical doctrines. In addition to this, Platonism continually acquired fresh adherents in consequence of the meagre logical system of the Schools, and its inaptitude to satisfy the human mind when awakened to inquiry. It presently allied itself to Mysticism, and engaged in the rational defence of doctrines derived from a higher source; supported by argument the Immortality of the Soul; and served to balance the Naturalism of the mere Aristotelians; but also unfortunately in some respects favoured superstition, especially by the doctrine of the Intervention of Superior Beings in the government of the world<sup>u</sup>. An honourable exception must be made in the case of Astrology, which it uniformly rejected.

### § 285.

C. HARTZHEIM, *Vita Nic. de Cusâ, Trevir.* 1730, 8vo.

Among the first of those who bade adieu to the Scholastic creed was the *Cardinal Nicolas Cusanus*<sup>x</sup>; a man of rare sagacity and an able mathematician; who arranged and republished the Neoplatonic System, to which he was much inclined, in a very original manner, by the aid of his Mathematical knowledge. He ventured upon some philosophical explanations of the mystery of the Trinity not easy to be understood nor defended, but of which so much may be stated, that he presumed the Almighty to be Unity, and the Father of Equality, and of that which associates and unites Equality to Unity; (by which he dared to signify the Son and the Holy Ghost). According to him, it is impossible to know directly and immediately this Absolute Unity (the Divinity); because we can make approaches to the knowledge of Him only by the means of Number or Plurality. Consequently he allows us only the possession of very imperfect notions of God, and

<sup>u</sup> FICINI, *Præfatio in Plotinum*; POMPONATIUS *De Incantationibus*, c. I.

<sup>x</sup> Nicolaus Chrypffs of Kuss or Kusel (hence called Cusanus) in the archbishopric of Treves; born 1401, died 1464.

those by the aid of Mathematical symbols. Absurd and worse than absurd as many of these ideas are, and inconsistent as he is both in other particulars, and inasmuch as he appears to have fallen into the grievous error and sin of identifying, in his theory of the Universe, the Creator and the Created;—obscure as he also is in his manner of stating these reveries, they contain nevertheless<sup>y</sup>, several profound observations imperfectly expressed, respecting the faculties of the understanding for the attainment of knowledge. For instance, he observes, that the principles of knowledge possible to us are contained in our ideas of Number (*ratio explicata*) and their several relations; that absolute knowledge is unattainable to us (*præcisio veritatis inattingibilis*, which he styled *docta ignorantia*), and that all which is attainable to us is a *probable* knowledge (*conjectura*). With such opinions he expressed a sovereign contempt for the Dogmatism of the Schools.

The examples of Pletho and Bessarion (§ 281) were improved upon by *Marsilius Ficinius*<sup>2</sup>, a Florentine physician, who engaged with zeal and ability in the defence of the Platonic philosophy; both by his translations of Plato, Plotinus, Iamblichus, Proclus, etc.; and also his original productions, devoted to the commendation of that system. Cosmo de' Medici, (who died 1464), availed

himself of his services in the foundation of a Platonist Academy, about 1460<sup>a</sup>. But Ficinus was a Neoplatonist, who added to the system of the Academy some Aristotelian doctrines, and regarded the Hermes Trismegistus of the Alexandrians as the inventor of the theory of Ideas. In his *Theologia Platonica* he displayed ability in the statement of certain arguments to establish the Immortality of the Soul<sup>b</sup>, and opposed the doctrine imagined by Averroes, and maintained by the Aristotelians, of an Universal Intelligence (257). The object he proposed to himself was to apply his views of the Platonic system to the defence and explanation of Christianity. His enthusiasm won over John Picus, count of Mirandola<sup>c</sup>, a learned man of superior parts, but extravagant imagination. He had studied the Scholastic philosophy and imbibed the notion that the philosophy of Plato was derived from the books of Moses, whence he was inclined to deduce all the arts and sciences<sup>d</sup>. In consequence of such a persuasion, he devoted himself to the study of the Oriental languages and Cabbalistical books; from which he drew a large proportion of the theses which he proposed to maintain in a public disputation as announced by him at Rome, but which never really took place<sup>e</sup>. From the same sources he drew the materials of his Essay towards a Mosaical philosophy, in his *Heptaplus*. He held in great esteem the Cabbalistical writings, to which he was tempted to ascribe a divine origin, and considered necessary to the explanation of the Christian religion; at the same time that he asserted their entire accordance with the philosophical systems of Pythagoras and Plato<sup>f</sup>. His favourite design, which however he not live to realise, was to prove the consistency of the Aristotelian and Pla-

tonic systems<sup>a</sup>. In his maturer age when he had emancipated himself from many of the common prejudices of his time, he composed an able refutation of the superstitions of the astrologers. The reputation of the Count of Mirandola, his works, and his numerous friends, contributed to establish the credit of the Platonic and Cabbalistical doctrines. His nephew *J. Fr. Picus* of *Mirandola* (killed 1533), followed his steps, without possessing his abilities; but more exclusively devoted than his uncle to Revealed philosophy<sup>b</sup>, he opposed at the same time the Heathen and the Scholastic systems.

### *Cabbalistic and Magical Systems.*

too full of daring reveries, and was far from possessing the influence enjoyed by the works of *H. Cornelius Agrippa* of Nettesheim°. The latter united to great talents universal information; but his greediness of reputation and money, and his fondness for occult sciences, imparted a character of indecision and inconsistency to his life as well as to his works. At Dôle he gave with the greatest success public lectures on the work of Reuchlin, *De Verbo Mirifico*; and at the suggestion of *Tritheim*, the most celebrated adept of his time, he composed his treatise, *De Occultâ Philosophiâ*<sup>p</sup>, a system of extravagant chimeras, in which Magic, the Complement of Philosophy, as he terms it, and the key of all the secrets of Nature, is represented under the three forms, of Natural, Celestial, and Religious or Ceremonial; agreeably to the three-fold division of the Corporeal, Celestial, and Intellectual Worlds. He there enumerates, with a show of scientific classification purely superficial, the hidden powers which the Creator has assigned to the different objects of the Creation, through the agency of the Spirit of the World. It was natural that Agrippa should become a partisan of Raymond Lulli (§ 269), and accordingly he wrote a commentary on his *Ars Magna*. Nevertheless his caprice sometimes inclined him to opinions directly the reverse; and in such a mood he rejected all dependence on human knowledge, and composed his *Cynical* treatise, as he terms it, *De Incertitudine et Vanitate Scientiarum*<sup>q</sup>. This work, which had great reputation in its day, occasionally presents us with sophistical arguments; occasionally with admirable remarks on the uncertainty and vanity of all scientific pursuits<sup>r</sup>. Agrippa and his follower *John Wier*<sup>s</sup>, were of service to philosophy by opposing the

belief in witchcraft. After an adventurous life, Agrippa died 1535, at Grenoble.

### *Theosophy.*

288. The physician and theosophist *Aureolus Theophrastus Paracelsus* (such were the names he assumed<sup>a</sup>), blended Chemistry and Therapeutics with the Neoplatonic and Cabbalistic mysticism. He was an ingenious and original charlatan, with much practical information, and a sufficiently penetrating spirit of observation, who though destitute of scientific information, aspired to the character of a reformer in Medicine. To effect this he made use of the Cabbalistic writers, whom he endeavoured to render popular, and expounded with a lively imagination. Among the principal mystic notions which he enlarged upon without method or consistency (very frequently so as scarcely to be intelligible), were those of an internal illumination,—an emanation from the Divinity,—the universal harmony of all things,—the influence of the stars on the sublunar world,—and the vitality of the elements, which he regarded as spirits encased in the visible bodies presented to our senses. His grand principle was a pretended harmony and sympathy between Salt, the Body, and the Earth: between Mercury, the Soul, and Water; between Sulphur, Spirit, and Air. His extravagancies found a good number of partisans<sup>b</sup>. As a mystic and theosophist *Valentine Weigel*<sup>c</sup>

<sup>a</sup> His real names were Philip Theophrastus Bombast von Hohenheim; born at Einsiedeln in Switzerland, 1493; died at Salzbουργ, 1541.

condemned him as heterodox, have accused him, without sufficient grounds, of atheism.

## II. *Revival of the System of Aristotle.*

### *Opponents of the same.*

See the work of J. LAUNOY, *De Variâ Aristot. Fort., etc.*, mentioned § 243.

W. L. G. BARON VON EBERSTEIN, *On the Logical and Metaphysical System of the Peripatetics, properly so called, Halle, 1800, 8vo.*

290. Nevertheless, the theories of Aristotle had many defenders. The Scholastic system had long nourished in the minds of men a profound veneration for the author of the *Organum*; and the education of the age inclined men to the reception of his ideas. When his works came to be known in their original form, they were eagerly studied, explained, translated, and abridged. Among the theologians, and physicians in particular, was formed a numerous school of his adherents. The latter especially, who were inclined to Naturalism, were enabled to restate on his authority certain doctrines belonging to Natural religion and philosophy. The distinction they drew between philosophical and religious Truth, served to protect them from the censures of some zealous theologians. In the fifteenth and sixteenth centuries the Aristotelians were divided into two sects: the *Averroists*, attached to the commentary of Averroes (§ 257), and the *Alexandrists*, or successors of Alexander Aphrodisiensis (§ 183). These two parties drew upon themselves so much notice by the acrimony of their disputes on the principles of Thought, and the Immortality of the Soul, that in 1512 the Lateran council endeavoured to cut short the dispute by pronouncing in favour of the more orthodox party.

### *Italian Peripatetics.*

291. Among the most renowned Peripatetics of Italy, we may remark *P. Pomponatius*<sup>a</sup>, of Mantua. His de-

<sup>a</sup> Born 1462, died 1525 or 1530.

PETRI POMPONATII De Naturalium effectuum admirandorum Causis seu

votion to the doctrines of Aristotle did not prevent his originating many of his own, and detecting the weak points of his master's system. He endeavoured to arouse his contemporaries to more profound investigations, discussing with singular force and acuteness various subjects, such as: The Immortality of the Soul,—Free-will,—Fate,—Providence,—and Enchantment, or Demonology (or to express it more fully)—the question whether the phenomena of nature which bear the appearance of being marvellous, are produced by the agency of Spirits (as the Platonists pretended), or that of the constellations. Having asserted that, according to Aristotle there is no certain proof to be adduced of the Immortality of the Soul, Pomponatius drew upon himself a violent and formidable controversy, in which he defended himself by asserting the distinction to be maintained between revealed and natural religion. Many superior men were formed in his School, such as *Simon Porta* or *Portius*<sup>b</sup>, *Paulus Jovius*<sup>c</sup>, *Julius Cæsar Scaliger*<sup>d</sup>, who subsequently opposed Cardan<sup>e</sup>; the cardinal *Gasparo Contarini*, and *Augustus Niphus*<sup>f</sup> (who became his adversaries): the Spaniard *J. Genesius Sepulveda*<sup>g</sup>; and lastly, the paradoxical free-

<sup>g</sup> Born 1491, died 1572.

thinker *Lucilio Vanini*<sup>h</sup>, burnt at Toulouse in 1619. Besides Pomponatius (who was the head of the school of Alexandrists), this sect boasted other learned men who were not among his disciples; such as, *Nicolas Leonicus*, surnamed *Thomæus*<sup>i</sup>; *Jacobus Zabarella*<sup>k</sup>, who differed on some points from Aristotle; *Cæsar Cremoninus*<sup>l</sup>, and *Francis Piccolomini*, etc. On the side of the Averroists, with the exception of *Alexander Achillinus* of Bologna<sup>m</sup> (who was styled the second Aristotle); *Marc Antony Zimara*<sup>n</sup>, of San-Pietro in the kingdom of Naples; and the famous Aristotelian *Andrew Cesalpini*<sup>o</sup>, we find no names of great celebrity. Cesalpini turned Averroism into an absolute Pantheism, by daring to represent the Deity not only as the cause, but as the subject-matter and substance of the world: and identified with the Universal Intelligence the minds of individual men, and even of animals. He asserted the immortality of the soul and the existence of Dæmons.

292. Although *Luther* and *Melanchthon*<sup>p</sup>, in the beginning of the Reformation entertained unfavourable sentiments towards the Aristotelian philosophy, on the same principle that they denounced the system of the Schoolmen, both, nevertheless, lived to renounce this prejudice, and Melanchthon especially, not only asserted the indispensability of philosophy as an auxiliary to theology, but recommended especially that of Aristotle, without confining this praise to his logic<sup>q</sup>. In Ethics, however, he maintained the principle of Morality to be the will of God. On one occasion only was war afterwards declared against philosophy (about 1621), by *Dan. Hoffmann*, professor of Theology at Helmstädt; and his two disciples, *J. Angelus Werdenhagen* (§ 321, note), and *Wenceslaus Schilling*<sup>r</sup>. The philosophy of Aristotle, disencumbered of the subtilties of the Schoolmen (though these were speedily succeeded by others), owed the favour which it enjoyed in the Protestant universities, to the authority of Melanchthon; and a swarm of commentaries and abridgments of this system presently appeared, which at all events served to keep in practice those attached to such studies. Among such we may particularise *Joachim Camerarius*, who died at Leipsic 1574.

The credit of Aristotle became in this manner re-established, and so continued till about the middle of the seventeenth century; nor was it materially affected by the desertion of a few, who like *Nicolaus Taurellus*<sup>s</sup>, the op-

ponent of Cesalpini, seceded a little from the prevailing doctrines.

*Opponents of the Aristotelian Philosophy.*

293. Notwithstanding, the adversaries of the Aristotelian system daily increased in number. Without touching upon other Schools more or less opposed to his (whose universality of system impeded *their* progress), we may enumerate, besides *Nicolaus Taurellus* just mentioned, *Franc. Patrizzi*, *Bruno*, *Berigard*, *Magnenus*, *Telesius*, and *Campanella*: (all of whom we shall have occasion to mention hereafter); with *Peter Ramus*<sup>1</sup>, one of the ablest opponents of the Peripatetic System, and a distinguished mathematician. He engaged in the dispute from a disgust for the technicalities of the Schools, and laboured to give popularity to a more accessible kind of philosophy, but was deficient in a true philosophical spirit, and without an adequate comprehension of the principles of Aristotle; which he attacked without measure or moderation; asserting that they were a tissue of error. Logic was the point he first objected to<sup>2</sup>; asserting that it was altogether factitious, without order, and without perspicuity; at the same time that he composed a new one<sup>3</sup>, more adapted to practical use, which he wished to substitute for that of Aristotle. He defined it to be, “*Ars bene disserendi*,” and considered Rhetoric to be an essential branch of it. Notwithstanding the attacks of his many enemies, who

were by no means temperate in their animosity, he attracted some partisans (called after him *Ramists*), especially in Switzerland, England, and Scotland. Among others, *Audomar Talæus*<sup>y</sup> (*Talon*), his two disciples *Thom. Freigius* of Fribourg<sup>z</sup>, and *Franc. Fabricius*; *Fr. Beuchus*; *Wilh. Ad. Scribonius*; *Gasp. Pfaffrad*<sup>a</sup>; *Rud. Goclenius*<sup>b</sup>, who gave his name to a species of Sorites; an Eclectic and able psychologist<sup>c</sup>; and *Otto Casmann*, a pupil of the latter, who laboured to complete a system of metaphysics relative to the human mind<sup>d</sup>. To these may be added the celebrated English poet *Milton*. The principal opponents of Ramus were, *Ant. Govea*, *Joach. Perionius*, and *Charpentier*, the Aristotelian, (see bibliography at the head of §§ 140, 141, 143); who also was his murderer on the day of St. Bartholomew. In Germany the principal were, *J. Schegk*<sup>e</sup>, *Nic. Frischlin*, *Phil. Scherbius*<sup>f</sup>, and *Corn. Martini*<sup>g</sup>.

### III. Revival of Stoicism.

294. The Stoic doctrines during this period were not altogether without partisans and supporters; but notwithstanding all the advantage they may be supposed to have derived from the dissemination of the works of Cicero and Seneca, and their seeming consistency with the Christian Morals, they did not gain as many adherents as some other philosophical systems. This is ascribable in part to the peculiar theories (in physics and morals) of the

Stoics, and partly to the influence of the prevailing spirit of the age, and the established forms of instruction. The writer who principally attached himself to these doctrines, at the period of which we are treating, was *Justus Lipsius* (Joost Lipss<sup>h</sup>). Originally he favoured the Scholastic system, which he abandoned for the cultivation of Classical literature; particularly the works of Cicero and Seneca. Celebrated as a critic and philologist, he became (though never in the proper sense of the word, a philosopher), an able expositor of the Stoic system. All that he wanted to make him a true Stoic, (as he himself has confessed), was Constancy and Consistency. He seems rather to have aimed at preparing the minds of his readers for the study of these doctrines, especially as given in Seneca, than to have attempted the restoration of the system. *Casp. Scioppius* (*Schoppe*)<sup>i</sup>, a man of equivocal character, published extracts from the works of Lipsius. *Thom. Gataker*, an Englishman<sup>k</sup>, occupied himself with the historical department of this system, as well as *Cl. Salmasius*, and *Dan. Heinsius*<sup>l</sup>.

## ORIGINAL ESSAYS AND PARTICULAR COMBINATIONS OF PHILOSOPHICAL SYSTEMS.

### I. *Various Essays.*

295. In the midst of these attempts to re-establish the theories of antiquity; while the old and the new doctrines were brought into constant competition, and the established system not only endeavoured to repulse the attacks which were constantly levelled at it, but to acquire

fresh credit by reconciling its discordant doctrines<sup>m</sup>; might be remarked from time to time some superior spirit who had the courage to quit the beaten track, and attempt a new one of his own; though unhappily, from the want of well-established principles for his guidance, he too usually fell into considerable errors. Among these we must reckon the German, *Nic. Taurellus*, already mentioned (§ 292), who laboured to draw a still stronger line of demarcation between philosophy and theology, and looked upon Reason as the proper source of philosophic knowledge. Of the Italians, *Cardan* (§ 289), and *Vanini* (§ 291), and of the French *P. Ramus*, who meditated a reform of philosophy. As by this time the old established Scholastic method of drawing all knowledge from abstract ideas, was insufficient to satisfy men's minds, they attempted to attain more certain conclusions by the way of experiment. This principle was especially followed up by the Political writers and Naturalists. Among the former *Niccolo Macchiavelli*<sup>n</sup>, a statesman, matured by the study of the Classics and by knowledge of the world, had in his *Principe* (1515) given with great ability a picture of Political men, such as he had generally found them: and *John Bodin*<sup>o</sup>, having in his *Republic* discarded the opinions of Plato and Aristotle, had endeavoured to explain the principles of a form of government neither a Monarchy nor a Democracy, and regulated by mixed principles of strict justice and accommodating policy.

## II. *Telesius*.

† Lives and Opinions of the most celebrated Physicians at the end of the Sixteenth and beginning of the Seventeenth Centuries. Published by TH. AUG. RIXNER and SIBER; fasc. III, Sulzb.

296. A Reformation was attempted in Natural Philosophy by *Bernardinus Telesius*. Born 1508, at Cosenza in the kingdom of Naples, he received a Classical education from an uncle at Milan, and subsequently, at Rome; and at Padua devoted himself with ardour to philosophical and mathematical studies, and from which he imbibed a disinclination for the doctrines of Aristotle. At a more advanced age he published with great success his work *De Naturâ juxta Propria Principia*<sup>p</sup>. He became a teacher of Natural Philosophy at Naples, and founded an academy named after him, *Telesiana* and *Consentina*; which was intended to demolish the Aristotelian philosophy. He was compelled by the persecutions he underwent from the monks to retire to Cosenza, where he died 1588. His system is one of pure Naturalism, and bears some resemblance to the views of Parmenides (§ 99). His chief objection to those of Aristotle is, that he laid down as principles mere abstractions, (*abstracta et non entia*). He himself maintained the existence of two incorporeal and active principles, Heat and Cold; and a corporeal passive principle, Matter; on which the other two exercise their influences. He derived the heavens from Heat, and the earth from Cold; and attempted, in a very unsatisfactory manner, to account for the origin of secondary natures by a supposed perpetual conflict between the Heavens and Earth. Having attributed sensation to his two incorporeal principles, he went on to assign souls to plants and animals in general. He drew however a broad

<sup>p</sup> The two first books appeared at Rome 1565, in 4to. The entire work was published at Naples in 1586 and 1588.

distinction between the immortal soul of Man, and that of other animals, and asserted that it was the immediate gift of God at the time of conception<sup>q</sup>. He maintained that Sensation was not absolutely passive, but a perception of changes operated in the mind itself<sup>r</sup>. Knowledge acquired by means of inference he described as a species of imperfect *Sensation*. Independently of these theories Telesius was an Experimentalist and Materialist. His adversaries *Marta* and *Chiocci* were, in their turn, attacked by Campanella<sup>s</sup>, (*infra*).

### III. *Franc. Patrizzi*, or *Patritius*.

† Lives and Opinions of the most celebrated Physicians, etc.; published by RIXNER and SIBER; fasc. IV: FR. PATRIZZI, *Sulzb.* 1823, 8vo.

297. *Fr. Patrizzi*<sup>t</sup>, the author of a new theory of emanation, borrowed the materials of it from all quarters, but principally from the Neoplatonists, and the pretended records of Primitive Mysticism collected by them; as well as from the system of Telesius. He commenced this undertaking by an elaborate refutation of Aristotle<sup>u</sup>. Nevertheless he attempted<sup>x</sup> a theory of light, according to the Aristotelian method. He affects to divide his subject into four parts, viz.: *Panaugia*, *Panarchia*, *Pampsychia* and *Pancosmia*: and cites to support his theories a number of apocryphal mystic books<sup>y</sup>. Wisdom he defines to be Universal Science. Light is in all things the primal object of knowledge. Philosophy, therefore, or the investigation of Truth, ought to begin with the

<sup>x</sup> Nova de Universis Philosophia in quâ Aristotelicâ Methodo non per Motum sed per Lucem et Lumina ad primam Causam ascenditur, etc., Ferrar. 1591, fol., Ven. 1593, Lond. 1611.

<sup>y</sup> Attributed to the ancient Persians.

contemplation of Light. 1. All Light is derived from the first source of illumination—God. 2. God is the highest principle of all things. 3. The universe is animated. 4. It is endowed with the qualities of unity and individuality by means of Space and Light; both of them incorporeal essences.

Such are among the principal ideas which Patrizzi follows up in the work above mentioned. It may be observed that this was not the last occasion when by metamorphosing material forms into Spiritual Essences, an alliance was attempted between the dreams of the Neoplatonists and the philosophy of Aristotle.

#### IV. *Giordano Bruno.*

300. The principal points of what may be termed his Theology are the following: God—the First Principle, is that which all things are, or may be. He is *One*, but in Him all essences are comprehended. He is the substance also of all things, and at the same time their Cause—(Final, Formal, and Creative):—Eternal without limit of duration; *Natura Naturans*. As the first Efficient Cause, He is also the Divine and Universal Intelligence which has manifested Itself in the form and fashion of the Universe: He is the Soul of the Universe, which permeates all things, and bestows upon them their forms and attributes. The end contemplated by this Great Cause is the perfection of all things, which consists in the development of the various modifications of which the different parts of Matter are susceptible. To be—to will—to have the power—and to produce, are identical with the Great Universal Principle. He is incomprehensible to us because Absolute and Uncompounded. His substance and his creative energies are determined by his Nature; He cannot act otherwise than he acts; His will is necessity; and this necessity, at the same time, the most perfect freedom. The Divinity, as the first and vital energy, has revealed Himself from all eternity in a variety of productions; yet continues always the same; Infinite, Immeasurable, Immoveable, and Unapproachable by any similitude. He is in all things, and all things in Him; because by Him and in Him all things live, act, and have their increase: He pervades the smallest portions of the Universe, as well as its infinite expanse: He influences every atom of it as well as the Whole. It follows, that all

things are animated; all things are good; because all things proceed from a Being essentially good.

301. Bruno follows the same train of ideas in his reflections on the world, (*Universum*, or *Natura naturata*), which he represents as One, Infinite, Eternal, and Imperishable. Nevertheless the world, in its external nature, and as containing the development of all things, is but the shadow of the Supreme Principle. Its element is *Matter*, originally formless; but, as united to, and identified with, the primitive and eternal Form, it virtually contains all possible modifications of form. He maintained that none had better expressed than Pythagoras, in his theory of Numbers, the manner in which all things are derived from the Infinite Being as Unity: towards which the human mind perpetually aspires. By the multiplication of its own Unity the First Principle causes the production of multifarious beings; but at the same time that It is the source of species and individuals beyond all calculation, It is Itself unlimited, and unconfined by Number, Measure, or Relation. It remains always One, and in every respect Indivisible; at once Infinitely Great and Infinitely Little. Inasmuch as by It all things are animated; the Universe may be represented as a Living Being: an immense and infinite animal, in which all things live and act in a thousand and a thousand different ways.

Bruno endeavours to establish by a variety of proofs this eternity of the world; from the immortal destiny of Man; from the infinitude of the Creator's power, which must be productive of like infinite effects; from the goodness also of the Divine Being; as well as by metaphysical arguments drawn from our ideas of Infinite space; and the impossibility of finding a Central Point; which last proof he ingeniously applies to the defence and confirmation of the Copernican system: refuting the opposite theories, especially that of the Peripatetics. As the material world is but a shadow and reflection of the First Principle, so our knowledge alto-

gether consists in the perception of Similitudes and Relations; and as the First Principle, descending from Its elevation, produced, by multiplication of Itself, the infinite diversity of natural objects; so do we gradually acquire the idea of Unity, by combining the multifarious objects presented to our senses. The end of all philosophy is this recognition of Unity existing in Contraries. —In Every individual the Soul assumes a particular form; inasmuch as its nature is simple and uncompounded it is immortal,—without limits to its energies,—and, by extension and contraction, it forms and fashions its own body.

To be born is the consequence of such expansion of the Centre; Life consists in the maintenance of a Spherical shape, and Death is the contraction into the same Centre. The highest end of all free-agents is the same with that of the Divine Intellect; namely, the perfection of the Whole.

Bruno's system is nothing more than that of the Eleatæ and Plotinus corrected and extended: a sort of Pantheism†, by many misunderstood as a system of Atheism; set forth with a persuasive eloquence springing from the author's own conviction, and with great richness of Imagination; and engaging the attention by a multitude of striking and noble ideas. The system of Bruno continued long neglected, or misunderstood, till the theories of Spinoza and Schelling directed towards it a degree of revived attention.

### V. *Sceptical writers.*

302. Many combined causes now gave birth to a new species of philosophical scepticism in certain calm and vigorous minds, which manifested itself according to the peculiar characters and habits of each. These causes

† [Pantheism, it will be remembered, presumes the whole Universe to partake of the Divine Nature; or, in other words, that the Divine Nature is extended to all parts of the Creation, and animates them all. *Trans.*]

were, the renewed study of the old philosophers; the awakened spirit of original investigation; the extended sphere of experimental observation; with the craving which began to be felt for more certain knowledge and better established principles; with all the discussions and theories which these causes set in motion, diversified according to the characters of their respective authors.

*Montaigne.*

Essais de Michel de Montaigne, *Bordeaux*, 1580; *Lond.* 1724; *Paris.* 1725, 3 vols. 4to; *Lond.* 1739, 6 vols. 12mo, etc.

Eloge de Mich. de Montaigne, Couronné à l'Acad. de Bordeaux en 1774 (par L'ABBE DE TALBERT), *Par.* 1775, 12mo. Eloge Analytique et Historique par DE LA DIXMERIE, *Par.* 1781, 8vo.

303. *Michel de Montaigne*, or *Montagne*<sup>\*</sup>, was the first of his age who inclined to the philosophy of Doubt. With a mind highly cultivated by the study of the Ancients, and of History; with great knowledge of the World and Men, he contemplated human life as it is presented to us, in its multiplicity and inconsistency; without analysing these discrepancies so as to arrive at unity and consistency. His acute observation of the disagreement existing between all philosophical theories produced in him a way of thinking akin to positive Scepticism in matters of philosophy; and he pronounced the *uncertainty of human knowledge* and the *feebleness of human reason* to be the grand conclusions to which all his observations had led him; reposing with a sincere faith on the authority of Divine Revelation. The uncertainty which he ascribed to all human science he extended even to matters of practice, without however denying the truth of practical obligations. His opinions are expressed with admirable candour and modesty in his delightful *Essays*, the originality and graces of which will always make the book a favourite with men of taste; though his philosophy has been very differently estimated by different

<sup>\*</sup> Born in a castle of the same name in Perigord, 1533; died 1592.

critics. Though his own character and conduct were free from the reproach of immorality and irreligion, his work has unquestionably the defect of not doing justice to its author's real sentiments; nay, even of encouraging the contrary.

*Pierre Charron.*

† De la Sagesse ; trois livres, par P. CHARRON, *Bordeaux*, 1601 ; edit. expurg. *Par.* 1604.

Eloge de P. Charron, par G. M. D. R. (GEORGE MICHEL DE ROCHEMAILLET), prefixed to the Works of Charron, *Par.* 1607. See BAYLE.

304. Montaigne had great influence over two distinguished authors of his own day: *Etienne Boëtie* (died 1563), Counsellor of the parliament of Bourdeaux ; who in his *Discours de la Servitude Voluntaire*, set forth with considerable talent his republican principles : and *Pierre Charron* (born at Paris 1541), a celebrated preacher, and a man of ability and estimable character ; but who in consequence of his intimacy with Montaigne, having unhappily contracted a habit of Scepticism, indulged in some unwarrantable speculations on religious topics. According to him, Wisdom (*La Sagesse*), is the free investigation of what is common and habitual. The desire of knowledge is natural to man ; but Truth resides with God alone, and is undefinable by human reason. On this principle he grounds another, of distrust and indifference with regard to all science ; a bold disbelief of Virtue (or the appearance of it) ; and even of great doctrines of Religion (particularly the immortality of the Soul) ; alleging that its external history did not correspond with its divine original, and the ideas he was pleased to form of God, and the worship of God. On the other hand he insisted upon the obligations of a certain Internal Religion connected with Virtue, and founded in the knowledge of God and Self, and exhorted to the practice of moral duties derived from a certain everlasting and imperishable law of Nature, which has

been implanted in the understanding by God Himself, and contains the highest Good of Man. This crude theory he expressed with some eloquence, and died 1603, decried by many as an atheist; which he did not altogether deserve.

305. We perceive that the human mind had, in the period of which we are treating, attempted many paths, already opened, to the mysteries of knowledge, by the ways of Revelation, Reason, and Experiment<sup>2</sup>. None of them had been pursued far enough; because, occupied with the pursuit of results and conclusions, men had omitted to begin by examining themselves, and their own faculties, instead of the objects contemplated by the latter. They had not yet inquired in what respects Revelation may be justly expected to supply information: nor had the pretensions of Experiment and Reason to be severally the fountain-heads of knowledge been balanced, or adjusted. A sort of Scepticism, grounded on experiment and observation, discouraged the pride of human reason, without having the effect of silencing its inquiries; and rather busied itself with diving again into the exhausted mines of ancient disputes, than attempted any fresh proofs of the Certainty of Knowledge. A species of intellectual anarchy and chaos seemed for a time to prevail: the more exact knowledge derived from the writings of the ancients contributing rather to increase than to still the commotion; till it ended in something like an universal *fermentation*, which slowly defecated. An immense mass of unorganised knowledge and misdirected views contended together, till the necessity came to be gradually felt of more systematic and better-founded inquiries; and to attain this end gigantic efforts were made, which became continually more effectual and more universal.

<sup>2</sup> [Reason and Experiment: the first is meant to imply the principle of the Rationalists: the latter of the Experimentalists, or Empirics. *Transl.*]

## MODERN PHILOSOPHY.

FROM THE SEVENTEENTH CENTURY TO OUR  
OWN TIMES.

*A free and progressive spirit of inquiry into the principles, the laws, and limits of human knowledge; with attempts to systematise and combine them.*

306. It was time that the human understanding should assume confidence in itself, and, relying on its own powers, force its way through the deep labyrinth of knowledge. Many causes which we have already enumerated combined to stimulate its exertions; and among the most powerful were the desire of elucidating the grounds of Religious and Moral knowledge; and the wish to reconcile and associate the Empiric and Rational systems. The philosophical systems of the Greeks continued to be examples of what might be effected, though they were no longer adhered to as models. The improvement in social habits, and the clearer views of moral duties, which Religion and established forms of Government had promoted, brought with them the necessity for a more perfect system of Ethics than was to be found in the theories of the Ancients; while the Scholastic system was found less and less capable of satisfying the demands of an increasing curiosity. The improvement effected in the Mathematical Sciences by Copernicus, Kepler, Galileo, and Toricelli, awakened a like enthusiasm among philosophers of another class; which the analogy subsisting between their pursuits tended to promote. The grand question which began to influence such speculations was, the Origin and the Certainty of Knowledge; with inquiries as to the ultimate grounds of Moral Right—Moral Obligation, etc.

*Bacon* and *Descartes* long exercised the most important influence over succeeding philosophers, and caused

their respective principles to become for a time universal. The spirit of inquiry had been first awakened in Italy; but, being repressed there, had acquired a much more extensive dominion in England, France, and Germany. The researches of these two great men were intended to complete the fabric of philosophy; but too impatient to arrive at the conclusion, they neglected to lay with sufficient care and accuracy a perfect foundation. Their followers felt themselves at liberty to consult their several tastes, and rushed either into a rashness of *demonstration*, which could end only in futility; or devoted themselves to perpetual *experiment*, unallied to any hypothesis: while sober investigation of the powers of the mind itself, as the source of knowledge was, for a long time, neglected by both parties. The factions too of the Speculative and Practical philosophers came to be opposed to each other: and, as each had much to object to the other, and much to say for themselves, they were successful in keeping up an interminable dispute, without any other result of their labours, but that of prejudicing the cause of philosophy in the minds of others. The Casuists and disciples of Thomas Aquinas on the one hand, and the Aristotelians (who preserved their authority among the Protestants, by whom Thomas was rejected) on the other, had long confined the attention of their disciples principally to Speculative questions; and Practical philosophy had been almost entirely resigned into the hands of theologians. Gradually it became the practice to confirm the decrees of Civil Legislation by arguments derived from Revelation or from Reason: and as this caused philosophy to become more practical, so the habit of deducing all duties and all moral obligation from the will of God, as their ultimate source, gradually exalted it to speculation; and brought about an union between the two systems, on the important subject of Morals.

The improvements effected in the present period may be described as consisting in:

A separation and distinction of Moral Philosophy from

##### I. *The Empirism of Bacon.*

MALLET's Life of Bacon, prefixed to his Works.

RAWLAY, the same; and R. STEPHEN, Letters and Remains of Lord Chancellor Bacon, *Lond.* 1734, 4to.

For the services rendered by Bacon to Philosophy, see HEYDENREICH, in his transl. of Cromaziano, vol. I, p. 306 (Germ.).

† SPRENGEL, Life of Bacon, in the (Halle) Biographia, vol. VIII, No. 1.

308. *Francis Bacon*, lord Verulam, appeared in England as a reformer of Philosophy; a man of a clear and penetrating judgment, great learning, great knowledge of the world and men, but of a character not free from reproach. He was born in London A. D. 1561: attained the highest offices in the state, which he ultimately lost through his failings, and died 1626. In his youth, he studied the Aristotelian system of the Schools, and the Classics. The latter study, as well as the practical pursuits to which he presently devoted himself, taught him the poverty and insufficiency of the former. In his maturer age he applied himself to consider the means of reforming the Method

of Philosophy, to which end he composed some works<sup>b</sup>, which by the new principles they developed had even greater influence over the fortunes of Philosophy than if he had completed an entire system of his own.

309. Bacon chose a new path, altogether diverging from the beaten one: instead of the *sylogistic* proof by *argument*, taking that of *experiment* by *Induction*: (which had been already imperfectly attempted by Telesius § 295), and proposing to re-construct the edifice of Human knowledge. Although his views may be said to be in some degree partial, yet he deserves the highest admiration and praise for his triumphant attacks on the School-philosophy; for having applied for information to Nature and Experiment; for having referred the question of Final Causes to Metaphysics rather than Physics; for the clear development of certain points in the Science of Mind, e. g. that of the Association of Ideas; as also by his well-digested refutation of some of the superstitions of his age, and the composition of his *Organum* as a new method of attaining to the knowledge of Nature; (B. I, Aphor. 19, sqq.); and by his book, *De Augmentis Scientiarum*, which contains a masterly review of the Sciences, with his views for their enlargement and improvement<sup>c</sup>. To show how far Bacon was from being a mere experimentalist, it is sufficient to refer to his expressions relative to the science and object of Moral Philosophy. Science, he says, is nothing more than the image of Truth, inasmuch as Truth in Reality, and Truth in Knowledge, only differ as a direct ray of light does from a refracted one<sup>d</sup>. The object of Philosophy is threefold,

<sup>b</sup> *De Dignitate et Augmentis Scientiarum* (Latin) 1623: (English), *Lond.* 1605.

His Works, *Amsterd.* 1663, 6 vols. 12mo., with a Life by W. RAWLAY: *Lond.* 1740, fol. 4 vols. by MALLETT: and 1765, 5 vols. 4to.

*Novum Organum Scientiarum*, *Lond.* 1620, fol.

<sup>c</sup> It is very likely that the works of Bacon suggested to J. BARCLAY his Treatise, called *Icon Animorum*, *Lond.* 1614, 8vo. We shall have occasion to speak of Cumberland and Hobbes presently.

<sup>d</sup> *De Augm. Sc.*, I, col. 18.

God—Nature—Man. Nature presents itself to our comprehension, as it were, by a *direct* ray of light, while God is revealed to us only by a reflected one\*.

† Doctrine of Campanella on Human Knowledge, with some Remarks on his Philosophical System, by FULLEBORN, Collect. Fasc. VI, p. 114.

We have already had occasion (§ 295) to mention one work of Campanella, to which we may add these, at present sufficiently rare :

De Sensu Rerum et Magiâ, *Francof.* 1620. Philosophiæ Rationalis et Realis partes V, *Paris.* 1638, 4to. Universalis Philosophiæ sive Metaphysicarum Rerum juxta propria Dogmata partes tres, *Paris.* 1638, fol. Atheismus Triumphatus, *Romæ*, 1631, fol. Ad Doctorem Gentium de Gentilismo non retinendo et de Prædestinatione et Gratiâ, *Paris*, 1636, 4to. Realis Philosophiæ Epilogisticæ partes IV: hoc est, De Rerum Naturâ, Hominum Moribus, Politicâ, cui Civitas solis adjuncta est, Œconomica cum Adnotationibus Physiologicis a Tobia Adami, nunc primum edita, *Francof. ad M.* 1623, 4to. Prodromus Philosophiæ Instaurandæ. Civitas Solis, *Ultraj.* 1643, 12mo.

Scelta d'Alcune Poesie Filosofiche di SEPTIMANO SQUILLA, 1632 (sine loco).

310. The contemporary of Bacon, *Thomas Campanella*, (born at Stilo in Calabria, 1568), made a like attempt to

\* De Augm. Sc. III, cap. 1.

deduce all knowledge from experiment. Endowed with superior talents, and carefully brought up, he entered the order of Dominicans, and pursued his philosophical studies as a novice in the convent of Cosenza; but when, by his own reflections as well as in consequence of the objections of Telesius\*, he was led to suspect the universal authority of Aristotle, he shook off the prejudices of his education, and endeavoured to satisfy his doubts by studying the remains of other ancient philosophers. But finding that these, as well as the remarks of Telesius himself, who attracted him by the freedom of his inquiries, were insufficient to set his mind completely at rest, he attempted knowledge by a path of his own. He admitted the existence of two sources, and only two, of all knowledge, *Revelation* and *Nature*: the first the origin of *Theology*, the last of *Philosophy*: in other words, the Histories of God and of Mankind. Scepticism, with Campanella, was but a transitory state of the mind: he was too eager to supply its place by a dogmatic edifice of his own; without having cleared his way to it by previous inquiry. He attempted too great a diversity of pursuits, and aspired to effect a reformation in every art and science, without having acquired a sufficient command of the necessary details. The adversities of his life contributed much to impede his progress as a philosophical reformer: for having been accused of disloyalty to the Spanish government, he was kept twenty-seven years in strict confinement; and when at last, in 1626, acquitted and set at liberty, was obliged to remove for security to Paris, where he died 1639.

311. Campanella had a clear and philosophical understanding, and extensive knowledge; with a genuine love of Truth; which last he asserted to be the proper foundation of all philosophy. *He* also proposed a new arrangement of the Sciences. His views were often just

\* [It will be remembered that Telesius was born at Cosenza, where he died 1588. *Transl.*]

and clear, but his hasty and impatient Spirit prevented his bringing them to perfection. His principal efforts were directed to the construction of a system of Metaphysics containing the principles of Theology, Natural History, and Morals. He looked upon the Metaphysics of Aristotle (so called) as nothing more than a sort of Logic, and a Vocabulary. Metaphysics is a *necessary* science, because our senses convey to us only that which is contingent and individual, without informing us as to the general relations of things and their real nature. Logic is not a science of that which is *real* and *necessary*—God and His creation—; but an art of language adapted to philosophy (Phil. Rat. II, 2). The only avenue to knowledge is by the Senses;—Sensation is the source of Knowledge (*Sentire est Scire*). Consistently with this theory he resolved into Sensation all the operations of the mind (such as Memory, etc.), and asserted that Thought itself is nothing but a combination of the results of Sensation; which combination itself is presented to us by means of Sense.

312. The object which Campanella had most at heart was the completion of a system of Dogmatism, which might be successfully opposed to Scepticism; and of which he gave a sufficiently accurate outline in his Metaphysics (lib. I). He either replies to the causes of doubt assigned by the Sceptic school, or invalidates them, or their consequences. He appeals to the natural desire felt by man to *know*, and to ascertain the *grounds* of knowledge. It is impossible even to deny the certainty of knowledge, without some ascertained principles of knowledge, which the Sceptic himself is compelled to refer to. He lays down certain incontestible principles of this kind drawn from general consent. Our senses inform us, That we are, and that we are possessed of power, knowledge, and will: That our power, knowledge and will are limited: That even as we ourselves enjoy these faculties, so are they enjoyed by others also. Campanella did not advance beyond these first principles, be-

cause he was satisfied that the external world was a Revelation afforded by the Divine Being (*operando*), which, when compared with the *Word* of God, afforded the only satisfactory means of knowledge.

313. The great Metaphysical problem is, to give an account of external objects, and their existence. To solve this Campanella begins with the axiom, That external objects exist and are presented to our senses. These appearances must be either true or false; agreeably to the obvious rule that a thing must either be, or not be; and to the laws (*Primalitates*) of existence and non-existence. The *Primal laws* of existence are, Possibility or Power, (*Potentia*); Knowledge (*Sapientia*), and Sympathy or Love (*Amor*). What can be—is: what is—must be. Every thing must possess sensation, and be the object of it; otherwise it would not exist to us. Every thing has its principle of self-preservation, and abhors annihilation; without which it could not endure, nor energise, nor exist. The *Primal laws* of *non-existence* are Impossibility (*Impotentia*); Ignorance (*Insipientia*); and aversion (*odium Metaphysicum*). The three objects of the Primal laws of existence are, Being, Truth, and Good, of which the outward token is Beauty. These principles conduct the argument up to the consideration of God; the highest Essence, or the highest Unity (Metaph. VII, 1, sqq.). Campanella then describes the attributes and operations of the Divine Unity: Necessity is the result of Power, Destiny of Knowledge, and Harmony of Love. He built his system of Cosmology on Theology, as well as his contemplations respecting Psychology, etc., in which he followed the ideas of the Neoplatonists and Cabbalists, as well as those of Telesius. He recognised in the world an Unity of Life, (*Mundum esse Dei vivam statuum*); and deduced his system of Divine Justice and the laws of necessity and chance, from certain considerations on the connection between Necessity and Existence; and Non-existence and Accident. He maintained the Existence of an Incorporeal world, and of Spirits, which

put in motion the stars. The Soul is a corporeal spirit, which can recognise its own nature to be subtile, warm, and light. From its efforts after felicity, (unattainable in this life), he argued its immortality.

In his *practical* system, which he grounded on the other, he brought forward several new ideas. The Infinite Being is the Supreme Good, the object and end of all things. Religion has revealed Him to us; and points out the way by which we may pass from the sensible to the invisible world, and to the highest attainable perfection. It consists in the obedience to God, the love of Him, and the contemplation of things earthly and Divine. Some striking ideas are disclosed respecting Natural and Revealed religion, Internal and External, Innate and Acquired.

314. The system of Campanella is to be praised rather for its negative than its positive qualities. He displayed a genuine love of knowledge and of truth in the contest he sustained with the Aristotelian System of the Schools, with Atheism, and the false Politics of Macchiavelli; as well as in the manner in which he asserted the right of the Understanding to attempt fresh and untried paths of Science; but he has shown himself unable to solve the grand problems of philosophy, by the inadequacy of his principles, the want of coherence in his system, and the slender union that subsists between his own ideas and those he has associated with them of others. It ought not, however, to be forgotten, that he had the merit of having first distinctly proposed such problems for solution, and attempted to effect the same, with views favourable to rational Knowledge and Religion.

(See his Treatise, *De Gentilismo non Retinendo*.)

### III. *Modifications of the Ionic and Atomistic Schools.*

*Basso, Berigard, Magnenus, Sennert, Gassendi.*

315. When the Aristotelian system was laid aside as confessedly deficient, particularly with respect to Natural History, an attempt was made to revive the Ionic and Atomistic doctrines. After *Sebastian Basso's*<sup>f</sup> attack on the Physics of Aristotle (see Bibliography § 143) many others came forward to revive ancient doctrines or propose new ones. *Claude de Guillemert de Bérigard*<sup>g</sup> advanced a theory, on the Eclectic plan, borrowed partly from the Ionians, and partly from the Atomic philosophers, and maintained that it was conformable to the Christian system, while he opposed the Aristotelian hypothesis of an original Matter<sup>h</sup>. Another Frenchman, *Jean-Chrysostôme Magnenus*<sup>i</sup>, recommended the system of Nature of Democritus, as affording an adequate solution of natural phenomena. *Dav. Sennert*<sup>k</sup> also attempted to remodel Physics on the principles of Democritus<sup>l</sup>. He maintained that Form and Matter are independent of each other, and asserted that Souls were created by the Divine Being out of Nothing; which brought him into a dispute with *J. Freitag*, (a professor at Groningen) in which he was defended by his disciple *J. Sperling*. *Pietro Gassendi*<sup>m</sup>, styled by Gibbon "the most learned of the philosophers of his age, and the most philosophical of the learned," undertook to defend and review with im-

tinguished Philologist, Theologist, Jurist, and Statesman, of great learning, and a clear and sound judgment, opened the way to a new study, that of International Law, by his celebrated work on the Rights of Peace and of War<sup>†</sup>, the first example of a philosophical statement of National Law. Some learned men had indeed prepared the way by similar labours, among others, *J. Oldendorp*<sup>‡</sup>, *Nicolas Hemming*<sup>§</sup>, *Bened. Winkler*, and *Alb. Gentilis*<sup>||</sup>. The humane and exalted mind of Grotius was led to this undertaking by the Christian wish to diminish, if possible, the frequency and the horrors of war. He took as the foundation of his argument the elements of Natural Right, and applied his immense erudition to show the universal assent paid by all nations to the principles of Right and Justice. His mode of proof was obviously a species of Induction, which he may have borrowed from his contemporary Lord Bacon. Grotius is sometimes carried away, by the abundance of his learning, from the course of his argument, but nevertheless distinguished himself above any of his predecessors by his superiority to prejudice, and prescription. He considers our idea of Right to be the result of a moral faculty, and derives its first principles from the *love of society (socialitas)*; hence the obligation of defending that society (*societatis custodia*); and distinguishes between *natural Right and Law, (Dictamen rectæ rationis)*, and *positive (Jus voluntarium)*, whether of Divine or Human original; fre-

quently tracing *positive* law up to Revelation as its immediate source. He draws a distinction also between perfect and imperfect Right: between legal and moral obligation. Although Grotius did but lay open this rich mine of inquiry, we are indebted to him not only for having suggested the pursuit, but for having contributed towards it a valuable stock of materials. His work has formed an era in literature, and been the subject of numerous, and often contradictory, commentaries. *Selden*<sup>b</sup>, by his Natural Law of the Hebrews, which was followed up by *Zentgrave*<sup>c</sup> and *Alberti*<sup>d</sup>, authors of the Natural Law of Christianity,—pursued a totally different system, and derived Right from the conditions of a state of Innocence.

RETTWIG, *Epistola de Veritate Philosophiæ Hobbesianæ*, *Brem.* 1695, 8vo.

316. The influence of Bacon's philosophy was, as might have been expected, especially felt in England. *Thomas Hobbes*, a friend of his, entered into some of his views, from which he deduced a system of Materialism. He was born in 1588, at Malmesbury. Like Bacon he had contracted from the study of the Classics a contempt for the philosophy of the Schools; and his travels and intimacy with his illustrious countryman, as well as with Gassendi and Galileo, had led him to think for himself. But the

*practical direction* which he laboured to give to his speculations, had the effect of limiting them. When the civil wars broke out, he proclaimed himself by his writings a zealous advocate of unlimited monarchy, as the only security for public peace. He died 1679; having published several mathematical and philosophical Essays, which have drawn upon him the reproach of fondness for paradox, and the stigma of Atheism.

His works: *Opera, Amstelod.* 1638, 4 vols. 4to. *Moral and Political Works, Lond.* 1750, fol. *Elementa Philosophica de Cive, Par.* 1642, 4to.; *Amstel.* 1647, 12mo. *Leviathan, sive de materiâ, formâ et potestate Civitatis Ecclesiasticæ, et Civilis, (English Lond.* 1651, fol.), *Lat. Lond.* 1656, 4to.). *Hobbes's Tripos, in Three Discourses, Lond.* 1684, 8vo.

§17. Hobbes appears to have aimed, above all things, at freedom and solidity in his speculations, and, rejecting every thing hypothetical, affected to confine himself to the *tangible*, or in other words, to the phenomena of Motion and Sensation. He defines philosophy to be the knowledge, on accurate principles, of phenomena resulting from present causes; or vice versâ the ascertaining of possible causes by means of known effects\*. Philosophy embraces as an object every body capable of producing an effect, and presenting the phenomena of composition and decomposition. Taking the term " " in its widest extent, he divides its meaning into Natural and Political, and devotes to the consideration of the first his *Philosophia Naturalis*, comprehending the departments of Logic, Ontology, Metaphysics, Physics, etc.; and to that of the second his *Philosophia Civilis*, or *Polity*, comprehending Morals. Knowledge is derived from the senses: but our per-

\* De Corp. p. 2.

ceptions are nothing more than the effect of external objects operating on the brain, or setting in motion the vital spirits. *Thought* is *calculation* (*computatio*), and implies addition and subtraction. Truth and Falsehood consist in the relations of the terms employed. We can become acquainted only with the Finite: the Infinite cannot even be imagined, much less known: the term does not convey any accurate knowledge, but belongs to a Being of whom we can form an idea only by means of Faith. Consequently, religious doctrines do not come within the compass of philosophical discussion, but are determinable by the laws of Religion itself. All, therefore, that Hobbes has left free to the contemplation of philosophy is the knowledge of our natural bodies, of the mind, and polity. His whole theory has reference to the External and Objective, inas-much as he derives all our notions from the senses, and describes the soul itself as something corporeal though of extreme tenuity. Instead of a system of pure metaphysics, he has thus presented us with a history of mind and its phenomena, deficient it is true in general depth, but which with some narrow and limited doctrines, contains occasionally others more enlightened and correct.

318. His *practical* philosophy, however, attracted more attention than his speculative. In this also, Hobbes pursued an independent course, and altogether departed from the line of the Schoolmen. His grand object was to ascertain the most durable posture the Body Politic could assume, and to define Public Right. An ideal form of government and state of morals had been imagined by Plato in his Republic, by *Sir Thomas More*<sup>f</sup> in his Utopia<sup>g</sup>, by *Campanella* in his Civitas Solis<sup>h</sup>, and by *Harrington*<sup>i</sup> in his Oceana<sup>k</sup>. Hobbes, on the con-

<sup>i</sup> Born at Upton, 1677.

<sup>k</sup> Lond. 1656. With his works, 1700 and 1737.

trary, assumes the existence of certain elements of Natural Right, which he supposes to have prevailed in a state of Nature anterior to civilization, contemplated according to the experimental method<sup>1</sup>. Agreeably to the lowest law of Nature man, if he does not aim at the injury of his neighbour, grasps at every thing which can contribute to his own well-being, and shuns every thing that can cause the contrary. Self-preservation is the highest object of his pursuit, just as death is of his avoidance. All that tends to this end, and to the removal of pain, is conformable to reason, and therefore lawful. Right is the liberty of employing our natural powers agreeably to reason. Man has therefore the right of self-preservation and self-defence; and consequently of using the means to this end: and he is himself the judge and arbiter of these means. But the consequence of these individual rights, in a state of nature, must be an universal collision of all; who must be perpetually brought into opposition with one another, to the destruction of all repose and security, and even of the power of self-preservation. Self-love, therefore, (or Reason), and the love of quiet, produce a new state of things, under the form of a civil compact, (*status civilis*), in which a portion of the individual liberty of each is resigned by him, and intrusted to one, or more. With this epoch commences that of external, obligatory Right. Absolute power on the part of the government, and implicit submission on the part of the governed, are necessary to the well-being of a state; and the best of all forms of government is therefore the monarchical.

Self-love is the fundamental law of Nature, and Interest the rule: the law of Nature is also the law of Morals (*lex moralis*). Hobbes has the audacity to refer to the Bible for confirmation of such doctrines, deduced from arguments of his own.

His success was not great, and the little which he had was principally among foreigners. Of the number of his

<sup>1</sup> In his treatise De Cive.

impartial judges, was the Dutchman *Lambert Velthuy-sen*<sup>m</sup>: and of his adversaries *Richard Cumberland*<sup>n</sup>, and *Robert Scharrock*<sup>o</sup>.

## VI. *Lord Herbert of Cherbury.*

319. Edward Lord Herbert of Cherbury<sup>p</sup>, followed a course exactly the reverse of that pursued by Hobbes, but equally opposed to the principles of true religion. He defended the notion of innate ideas, and derived our knowledge not from the understanding nor the senses, but from a certain *instinctive reason*<sup>q</sup> to which he made the former subordinate. Instead of tracing our acquaintance with religion (according to his ideas of it) to historical tradition, as Hobbes had done; he derived it from a supposed *internal illumination* afforded to all mankind. Agreeably to these views, he pursued his researches on the Rational instead of the Empiric method, particularly with respect to the nature of Truth; on which subject he published a separate work<sup>r</sup>. He described the soul not as a *tabula rasa*, but as a *closed book*, which opens only when Nature bids it. It derives from itself its knowledge of general truths (*communes notitiæ*); which are so far common to all men; and ought to remove doubts and differences in philosophy and theology. He maintained the existence of what he was pleased to call an Intellectual Religion, and claimed for this religion of his own the right to ex-

amine and *verify* all other pretensions to revelation<sup>s</sup>. The obscurity of his own thoughts and expressions, and the dominion at that time enjoyed by the experimental system of philosophy, caused him to be but little noticed in his day. He was however justly attacked by Divines, as an enemy to Revealed religion.

## VII. *Mystical Naturalists and Theosophists of this period.*

320. J. Baptist *van Helmont*<sup>t</sup> about this time united a study of the phenomena of Nature to a degree of mysticism. He had been taught at Louvain the Scholastic system, by the Jesuit Martin del Rio; and had imbibed from the study of Kempis, Tauler (§ 275), and Paracelsus, a degree of enthusiasm which he carried into his art, that of medicine. With many fanciful notions of his own, he nevertheless detected errors in others, and started several good ideas. In order to effect by means of Alchemy and Philosophy a reformation in his own art, he devoted himself to the investigation of the *Universe*. With such a design, he attached himself principally to the doctrines of Paracelsus, and derived all knowledge from direct and immediate revelation. He maintained that all Nature is animated; but, at the same time, asserted that nothing earthly partakes of the Divine Nature, which is incommunicable. All corporeal beings are replete with spirits, which by means of air and water, the only true elements, and their mutual fermentation, produce every thing else. Such were the principles of his spiritual Physiology<sup>u</sup>. His son, *Fr. Mercurius van Helmont*<sup>x</sup>, endeavoured to enlarge our knowledge of "The divine Science"—(Theosophy); and

by a new division of the different orders of Beings and their relations to Unity, sought to compose a system which might combine the doctrines of the Platonists and Cabbalists with those of Christianity. He taught especially the theory of an universal Sympathy of all things, with many strange notions about the relations of the soul to the body, and of the body to the soul, asserting that they differed not in essence but in form, and stood in the relation of Male and Female. To this he added a sort of Metempsychosis, combined with a belief in the necessity of a future judgment after death<sup>†</sup>. *Marcus Marci von Kronland*<sup>‡</sup>, set forth a system of Cosmology of his own, in which he blended the Ideas of Plato with the Forms of Aristotle, and endeavoured to destroy the *qualitates occultæ* of the Schoolmen to make way for his *ideæ seminales*, which he affected to consider more intelligible. These *Ideas* are the Powers of Nature which, with the aid of light, create and form all things. Nay, the very constellations operate on the sublunary world by means of light, and by the agency of the Ideas<sup>§</sup>.

321. In England the enthusiastic system of Paracelsus found a patron in the learned physician *Robert Fludd*<sup>b</sup>, who sought to ally it to the Mosaic history of the creation<sup>c</sup>. He was answered by *Gassendi*. In Germany a like enthusiasm laid hold on the pious and inquisitive

<sup>c</sup> Historia Macro-et Microcosmi Metaphysica, Physica et Technica, Oppenh. 1717. Philosophia Mosaica, Guda. 1638.

temper of the shoemaker of Görlitz, *Jacob Böhm*<sup>d</sup>, who with a mind highly excited by the study of the Scriptures, to which he added the natural philosophy of Paracelsus and his contemporaries;—with a peculiar depth of thought, disfigured by a rude unscientific manner and a barbarous style, (partly composed of the terms of Chemistry then in use),—gave vent to his speculations, (often unintelligible and often profound), respecting the Deity and the Origin of all things. He affected to deliver these as something oracular, and wrote in his native language, whence his appellation of *philosophus Teutonicus*. His mysticism gained disciples in Germany, and even abroad, being adopted in France by *Poiret*, and in England by *H. More*, and *John Pordage* a physician; who even wrote a commentary on him. Of all these hereafter. In more recent times *St. Martin* has given as it were a new and able version of this species of Theosophy.

322. Böhm and Fludd had endeavoured to find authority in the Bible for their own extravagancies. The like attempt was made by others, particularly by *Jo. Amos Comenius*<sup>e</sup>, who in his *Synopsis Physices ad lumen Divinum reformatæ*<sup>f</sup>, detailed more clearly the opinions of Fludd and others. He supposes three elementary principles of all things; Matter, Spirit, and Light. The first is the corporeal essence, the second is subtile, self-existing, invisible, imperceptible, dispensed by the Divine Being to all living creatures, to animate and possess them. Light is the plastic spirit; an intermediate essence, which penetrates matter and prepares it for the

admission and reception of spirit, investing it at the same time with a form. He has also originated some remarkable ideas on philanthropy, in which he followed Val. Andreae<sup>s</sup>. *J. Baier*, the successor of Comenius<sup>b</sup>, and some others, have bequeathed works to the same effect.

### VIII. *Sceptics.*

323. Scepticism was revived and extended by *Fr. Sanchez* (Franc. Sanctius), a Portuguese<sup>i</sup>, who taught medicine and philosophy at Toulouse with considerable reputation, up to the time of his death, which happened in 1632. He was obliged by his office to teach the Aristotelian system, and not venturing openly to controvert it, assailed it under cover of his Scepticism; and having proved by means of arguments already brought forward, but to which his lively manner imparted an air of novelty, the uncertainty of human knowledge, he undertook to give in another work a method of his own for attaining to certainty. This promised work, however, never made its appearance. *François de la Mothe le Vayer*<sup>k</sup>, an author of great learning, talent, and judgment, enlarged upon the grounds of Scepticism, with a reference to Science and even to Religion. He denied the existence of any common rational foundation for the

latter, in consequence of the diversities of belief that have always prevailed, and maintained that reason in theology must give place to faith, a superior faculty, and conferred immediately by Divine Grace. In other respects he showed himself a decided unbeliever; representing life as a miserable farce, and virtue as almost a dream.

## RATIONALISM OF DESCARTES, AND THE SYSTEMS TO WHICH IT GAVE RISE.

P. DE VILLEMANDY. See § 139.

324. *René Descartes* (Cartesius), was born 1596, at La Haye, in the Touraine, and attempted a reformation in the philosophy of his country by a method opposed to the Experimental, on the principles of pure Rationalism. His system was favourable to independent research, and met with equally violent opponents and partisans, attracting, as it did, universal attention. In the school of the Jesuits at La Flèche he early distinguished himself by the quickness of his parts, and his love of knowledge. Fired with this passion and eager to satisfy it by study, he devoured without a plan a multitude of books, which working upon his own ardent temper, left him more uncertain than he was at first; his subsequent travels instead of curing contributing to increase the malady. Presently his adventurous spirit conceived the plan of erecting a philosophy of his own; no part of which should be borrowed from others. With this view he repaired to Holland, where he trusted to find leisure and freedom, and where he composed the greater part of his works<sup>1</sup>. He presently attracted great attention, became involved in controversies, especially with theologians, and after maintaining an extensive and learned correspondence, was invited into Sweden by Queen Christina, and died there shortly after in 1650.

His works : *Opera*, *Amstelod.* 1692-1701, 9 vols. 4to. *Opera Philosophica*, *Francf. ad M.* 1692, 4to. *Principia Philosophiæ*, *Amstel.* 1644-1656, 4to. *Meditationes de Primâ Philosophiâ*, etc., *ibid.* 1641, 4to. *Discours de la Méthode pour bien conduire la Raison et chercher le Vérité dans les Sciences*. Tractatus de Passionibus Animæ*, *ibid.* 1656, 4to. *Tractatus de Homine et de Formatione Fœtûs*, cum *Notis Lud. de la Forge*, *ibid.* 1677, 4to. *Epistolæ* (translated), *ibid.* 1688, 4to.

325. Descartes was not merely a metaphysical philoso-

<sup>1</sup> Between 1629 and 1649.

pher: he was distinguished as a mathematician, an astronomer, and a physiologist. His very reputation and success as a philosopher, was in a great measure owing to the discoveries he effected in those sciences. His object was to constitute philosophy a demonstrable science; but he rushed too eagerly from the state of doubt, which he considered a necessary preparation for all knowledge, to knowledge itself. He begins with the experimental observation of Consciousness and Thought: and from this concludes the existence of the thinking subject—(*cogito: ergo sum*)—of the soul; which thus distinguishes itself from material substances, and consequently is independent of them. Its essence consists in *thought*, and is on that account more easy to be recognised than that of the body. Clearness and distinctness he regarded as the criteria of truth. The soul does not contemplate all subjects with equal distinctness, which proves its nature to be imperfect and finite. It possesses, nevertheless, the idea of an Absolute, Perfect Being, or Spirit; the first and necessary attribute of whom is existence<sup>m</sup>; and as such ideas cannot be derived from the Imperfect Soul, they must flow from the Perfect Being to whom they relate, and consequently must be innate. On this recognition of the existence of an All-perfect Being, the evidence and certainty of all absolute knowledge is grounded; on the principle that the Divine Being will not suffer us to fall into error while lawfully employing the faculties for knowledge bestowed by Him. The

<sup>m</sup> SAM. WERENFELS, *Judicium de Argumento Cartesii pro Existentiâ Dei, petito ex ejus Ideâ*; in his *Dissertatt. var. Argument. Pars. II*; and, on the other side, JACQUELOT, *Examen d'un Ecrit qui a pour titre, Judicium de Argumeto*, etc. Many articles on the subject appeared in the *Journal des Savans*, 1701; the *Histoire des Ouvrages des Savans*, 1700, 1701, and the *Nouvelles de la République des Lettres*, 1701, 1702, et 1703.

essence of the body consists in expansion. The body and the thinking essence,—(the body, that is, and the soul,—are essentially opposed to each other.

326. God, as the Infinite Being, is the author of the universe, which is infinite; but the material and intellectual parts of which it is composed are imperfect and finite. The assistance or co-operation of the Divinity (*assistentia sive concursus*) is necessary to the very preservation and maintenance of these<sup>n</sup>. Descartes did not distinguish between Matter and Space, and consequently found no difficulties to oppose the application of his theory of *vortices*, (which he described as deriving their immediate impulse from God), to account for the phenomena of Creation.

The Soul he asserted to be simple in its nature, or in other words, purely *immaterial*, (spiritualism of Descartes), but intimately connected with the body. The pineal gland may be supposed to be its seat, because it there appears to energise in immediate connection with the vital spirits. From the immateriality of the soul he deduced its immortality; and lest he should be obliged by his argument to extend the same properties to other animals, he pronounced these to be *living machines*. The soul is free, because it feels itself to be so; and in its freedom consists its liability to error. He drew a distinction between the passive impressions and the active decisions (*passiones et actiones*) of the soul. The operations of the Will, the Imagination, and Thought, belong by their nature to the latter class. He constituted three classes of Ideas, those which we acquire, those which we create, and those which are born with us. The first are derived from external objects, by means of impressions communicated to our organs. Vital warmth and motion do not proceed from the Soul, but from the Animal

<sup>n</sup> This doctrine was converted by GEULINX and others into one of *Occasionalism*. See § 328.

Spirits. He accounts for the communion existing between the Soul and Body by his doctrine of *Assistentia*. The Soul determines the direction of the Vital Spirits.

327. Notwithstanding the confusion Descartes made between Thought and Knowledge,—the want of solidity in his principles, and of conclusiveness in his inferences, as well as the many contradictions they imply, which would have become more apparent if he had treated the subject of Morals also, we cannot shut our eyes to the great effect produced by his philosophy. His discussions awakened men to independent thought, both by their matter and their manner,—the form as well as the substance of his doctrines, no less than by their bold and striking character. Men were impelled to investigate the principles of Thought and Knowledge, and the differences which exist between them; efforts were made to decide the controversy between Experimentalism and Speculative philosophy, between Rationalism and Supernaturalism; at the same time that he gave the last blow to the Scholastic system, and introduced into the philosophical world a new life and energy, animating to the pursuit of Truth and the detection of Error. His doctrines presently attracted the notice of a great number of distinguished thinkers. In *Hobbes*, *Gassendi*<sup>o</sup>, *P. Dan. Huet*<sup>p</sup>, *Gabr. Daniel*<sup>q</sup>, etc., he encountered able adversaries, who subjected his leading principles to a severe, but at the same time calm and philosophical examination; but he was attacked in a more intemperate manner by several schoolmen and theologians, such as

<sup>o</sup> GER. DE VRIES, *Dissertatiuncula Historico-Philosophica de Renati Cartesii Meditationibus à Gassendo impugnatis*, *Ultraj.* 1691, 8vo.

<sup>p</sup> *Censura* etc. (see bibliography § 324). This work called forth several answers.

<sup>q</sup> See his *Romance: Voyage du Monde de Descartes*, *Paris*, 1691, 12mo. *Iter per Mundum Cartesii*. *Amstelod.* 1694, 12mo. *Nouvelles Difficultés proposées par un Péripatéticien*, *Amst.* 1694, 12mo. *Idem en Lat. Novæ Difficultates*, etc. *ibid.*

*Gisbert Voetius*<sup>r</sup>, *Martin Schoock*<sup>a</sup> the Eclectic, *Cyriac Lentullus* the Jesuit, *Valois*, and others, who taxed him with Scepticism and Atheism. A number of talented persons were formed in his school, or attached themselves to his system; and in spite of the interdictions levelled against it in Holland by the Synod of Dort (1656), and also in Italy (1663), it gained ground in the Netherlands and France. In England, Italy, and Germany, it made less progress, though it produced an effect on all departments of Moral Philosophy, Logic, Metaphysics, and Morals<sup>t</sup>, nay even on Theology<sup>u</sup>.

328. Among the partisans of the philosophy of Descartes we may specify his friend *De la Forge*<sup>x</sup>, a physician at Saumur; *Claude de Clerselier* (died 1686), the editor of his posthumous works; *Jacques Rohault* (died 1675); *Pierre Sylvain Regis*<sup>y</sup>, a pupil of the latter, and an able commentator on Descartes; with many Jansenists of the Port Royal<sup>z</sup> who opposed a more rigid morality to

<sup>z</sup> Among other distinguished works, this society has produced, *l'Art de Penser*, Paris, 1664, 12mo. Translated into Lat. by J. C. BRAUN, with a preface of FR. BUDDEUS, Hal. 1704, 8vo. (This treatise has been sometimes improperly ascribed to ARNAULD).

the doctrines of the Jesuits. Among these were *Ant. Arnauld*<sup>a</sup>, *Blaise Pascal*<sup>b</sup>, *Nicole*<sup>c</sup>, and also, *Father Malebranche* (see § 331), *Antoine Le Grand*<sup>d</sup> a physician at Douai, *J. Claubery*<sup>e</sup>, *Adrian Heerebord*, and more particularly *Arnold Geulinx* of Antwerp<sup>f</sup>. From the principles of Descartes, the last derived the doctrine of Occasional Causes (*Systema causarum occasionalium—Occasionalismus*) which supposed the Deity to be the actual cause of the motions of the body and affections of the mind, the soul and the limbs merely affording the means of their development. This notion was extended and explained by *Balthazar Becker*, *Volder*, *Malebranche*, and *Spinoza*. Geulinx added to this strange doctrine a pure system of morality, and maintained that the main defect of Ancient and Modern systems of Ethics was the encouragement afforded by them to Self-love;

and made Virtue to consist in a pure love of—(*amor affectionis non affectionis*),—and devotion to the injunctions of practical Reason; or, in other words, in obedience to God and to Reason, for the sake of Reason itself. The characteristics of Reason thus contemplated he pronounced to be attention (*diligentia*), docility (*obedientia*), conformity to moral obligations (*justitia*), and a disregard of all other goods (*humilitas*). Though his ideas on Morals were often admirable for their truth and refinement, they did not meet with much success; partly because they were entangled with his doctrine of Occasionalism; and partly because the foundations on which they should rest were not perfectly established; added to which they prescribe nothing but a blind submission to the Divine will, to such a degree as almost to take away the free exercise of Reason. *Balthasar Becker*<sup>s</sup>, taking for his ground the doctrines of Occasionalism, and the Spiritualism of Descartes, denied that men were capable of being influenced by the agency of Spirits; and in particular attacked the opinions then prevalent in favour of sorcery and witchcraft; which cost him his employment. On the other hand *Pierre Poiret*<sup>h</sup>, at first a Cartesian, then a Mystic, affected to deduce from the principles of Descartes, a proof of the immediate agency of God and of spiritual beings on the mind of man. Several theologians and philosophers endeavoured to reconcile the Cartesian system to Revealed Religion, and defended or explained it in writings partly didactic and partly polemical. Among others may be enumerated *J. Cocce-*

329. The Jew *Baruch (Benedict) Spinoza*, or *Spinoza*, entered into the speculative views of the Cartesian School with all the originality of a profound and penetrating genius. He was born at Amsterdam, 1632, and even in his childhood distinguished himself for his ardent love of knowledge. His doubts with respect to the authority of the Talmud, and his frame of mind, devout, but free from superstition, rendered him indifferent to the ceremonial part of his own faith, and were the means of bringing upon him many persecutions. Concealed in the houses of some charitable Christians, he applied himself to the study of Latin and Greek, Mathematics and Metaphysics, especially those of Descartes, the clearness and simplicity of whose system attracted his attention, without being able to satisfy his judgment. After having devoted his life to contemplation, pursued in retirement, he died at the Hague, A. D. 1677, with the reputation of an estimable man, and distinguished philosopher. Spinoza made it his principle to admit nothing to be true, the

grounds of which he could not distinctly recognise; and endeavoured to found his system of Ethics, (as he termed it), on something like Mathematical demonstrations of the principles of Moral Life, founded on the knowledge of God. These speculations carried him into the highest region of Metaphysics, and gradually led him to the remarkable theory proposed also by Descartes<sup>o</sup>, which asserts the existence of only one Absolute Essence,—(the Deity),—Infinite Being, with Infinite Attributes of Expansion and Thought, reducing all finite beings to the state of Apparent Essences, and limitations or *modi* of those Attributes. *Substance* is not an individual being, but the foundation and substratum of all individual beings: It never has begun to be, but exists *per se* and of necessity, (see Eth. P. I, prop. 5). Nothing can be said to have a beginning but finite objects, or the mutable limitations of the Attributes of Infinity: in this manner from the Attribute of Expansion arises the modification of Motion and Repose: from that of Thought those of the Understanding and Will. Infinite Expansion is, on the same principle, the ultimate Element of all finite corporeal objects; and Absolute or Infinite Thought, of all finite thinking beings. The primordial Elements—Infinite Expansion and Infinite Thought—are mutually related, without having been produced the one by the other. All finite things (e. g. Body and Soul) exist in the Deity: The Deity is their *inherent Cause, Natura Naturans*. He himself not finite, though from him all finite things have necessarily proceeded; there is no such thing as Accident, but an universal Necessity; which in the case of the Deity is united to Liberty: because the Deity alone is not circumscribed by the existence or operations of any other being. He operates according to the *internal necessity* of His own nature; and His will and knowledge are inseparable. There is no free Causality

<sup>o</sup> H. C. W. SIOWART über den Zusammenhang des Spinozismus mit der Cartesianischen Philosophie, Tübing. 1816, 8vo.

H. RITTER über den Einfluss des Cartes. auf die Ausbildung des Spinozismus, Leips. 1816, 8vo.

of Ends and final Causes; but only the Causality of Necessity and natural Causes. The immediate and direct conception or idea of any real and present object is called the Spirit or Soul (*Mens*) of such object; and the thing itself, or the direct and immediate object of such idea or conception is called the *Body* of such Spirit. United, they compose one and the same individual object; which may be apprehended in a twofold relation, under that of the Attribute Thought, or the Attribute Expansion. All ideas, as far as they have a relation to the Deity, are true: because all ideas which exist in the Divine mind are perfectly correspondent to their respective Objects; and consequently every idea of our own which is absolute and corresponds with its object, is true also<sup>p</sup>; and the understanding contemplates things according to their true nature inasmuch as it contemplates them with a view to their eternal and necessary properties<sup>q</sup>. Falsehood has its origin in the negation of Thought; and the admission of irregular and imperfect notions<sup>r</sup>. Every idea of a real object embraces at the same time a conception of the eternal and infinite essence of God, (Prop. 45); and consequently by a knowledge of the first we may attain to an adequate comprehension of the Divine nature. The human mind can therefore indisputably apprehend the nature of God<sup>s</sup>. On the other hand, the knowledge we are able to acquire of individual objects is necessarily imperfect. In the lively contemplation of the Deity consists our greatest happiness: Since the more that we know of God, the more inclined we are to live according to his will<sup>t</sup>; in which consists at the same time our happiness and our free-will:—Deo parere summa

<sup>p</sup> Prop. 43. Sicut lux se ipsam et tenebras manifestat, sic veritas norma sui et falsi est.

<sup>q</sup> E naturâ rationis non est, res ut contingentes, sed ut *necessarias* contemplari (et) sub quâdam eternitatis specie percipere. Propos. 44.

<sup>r</sup> Eth. P. II, Propos. 32—34 sqq.

<sup>s</sup> Prop. 46, 47.

<sup>t</sup> Amor Dei non nisi ex cognitione ejus oritur; Tract. Theol. cap. IV, p. 42.

*libertas est.* Nevertheless our Will is not absolutely free, inasmuch as the mind is directed to this or that end by some external cause, which cause is dependent on another, and so on in perpetual concatenation. In like manner no other faculty of the mind is altogether absolute and uncontrolled (P. II, prop. 48).

330. The rude materials of his system Spinoza had amassed in the course of his early study of the Rabbini- cal writings, and the theory of Descartes had only supplied him with a scientific form. He draws all his conclusions, after the mathematical method, by a regular deduction from a small number of axioms, and a few leading ideas, which he assumes to be self-evident, such as those of Substance and Causality. His conclusions have all an appearance of mathematical strictness, but appear to labour in this respect, that it may be questioned how the infinitude of finite objects is a necessary result of the infinite attributes of the Deity. The grand defect of his theory is, that all Individuality and Free-will is lost in subordination to the Divine Essence, and that his system of Ethics is made one of mere Physics, because all finite things are made necessarily subject to the Divine Nature, and appertain to it as modifications of its attributes, forming parts of an universal system of absolute Causality<sup>a</sup>. The profoundness of his ideas; the syllogistic method of his reasoning; the hardihood of his attempt,—to explain things *finite* by *infinite*,—give an air of obscurity to the whole system, and make it difficult to be apprehended in true sense: it does not, however, deserve the appellation of an atheistic theory, which has been liberally bestowed upon it ever since its first appearance, rather in consequence of the passions of the disputants, than from any thing contained in the work itself. It may rather be called a system of Pantheism (not *material* like that of the Eleatæ, but *formal*), which embraces and illustrates a noble idea of the Divinity, as the

<sup>a</sup> Ep. 62. See Tract. Theol.-Polit. cap. XVI.

Primal Cause of Being, so far as it may be investigated by speculations purely ontological. Nevertheless, such a conception does not satisfy the understanding, and contradicts the principles of Theism, especially in their *practical* relations and application.

331. Spinoza's character was no less misrepresented than his doctrines. Few at first dared to profess themselves his friends and adherents<sup>x</sup>. His first opponents, either from not having understood his system, or from some secret attachment to it which they were at pains to conceal, allowed him to have the advantage, and contributed to his reputation. Of this number were: *Fr. Cuper*<sup>y</sup>, *Boulainvilliers*<sup>z</sup>, *Chr. Wittich*<sup>a</sup>, (who answered him the most fully of them all), *P. Poiret*<sup>b</sup>, *Sam. Parker*, (§ 333), *Isaac Jacquelot*<sup>c</sup>. Those who undertook the conflict with more sincerity (such as *J. Bredenburg*<sup>d</sup>), found

<sup>x</sup> Of these we may mention, J. Oldenburg, who nevertheless, on many points, differed from Spinoza. The following writers have, perhaps improperly, been designated as Spinozists: the physicians, L. MEYER and LUCAS, the first the author of a work entitled, *Philosophia Sacræ Scripturæ interpres*: see § 327, note; Z. JELLES, ABR. CUFÆLER, who defended and explained Spinozism in two treatises: *Specimen Artis Ratiocinandi Naturalis et Artificialis ad Pantosophiæ Principia Manuducens*, Hamb. (Amst.) 1684; et: *Principiorum Pantosophiæ*, P. II. et P. III, Hamb. 1684; J. G. WACHTER, *Concordia Rationis et Fidei*, etc., Amstel. (Berol.), 1692, 8vo.; and THEOD. LUD. LAW: *Meditationes de Deo, Mundo, et Homine*, Francof. 1717, 8vo.; et: *Meditationes, Theses, dubia Philosophico-Theologica*, Freystadt. 1719, 8vo.

<sup>y</sup> *Arcana Atheisme Revelata*; a work severely censured by H. MORE, *Opp. Philos.* tom. I, p. 596, and by JÆGER: *FR. CUPERUS mala Fide aut ad minimum frigidè Atheismum Spinozæ oppungans*, Tub. 1710.

<sup>z</sup> The Comte de Boulainvilliers; born 1658, died 1722. See bibliography of § 328.

<sup>a</sup> See § 328.

<sup>b</sup> See § 328. POIRET, *Fundamenta Atheismi eversa*, in his *Cogitata de Deo*, etc.

<sup>c</sup> Born in Champagne, 1674; died 1708.

themselves involved in contradictions, being unable to refute the sophistry of Spinoza, and not enduring to admit its validity.

It is only of late that the talents and opinions of Spinoza have been better appreciated; at the same time that the *Critical* method of the rationalists has enabled them to detect the weak side of his system\*.

The most recent philosophical system approaches in many respects that of Spinoza.

### III. Malebranche. Fardella.

FONTENELLE, Eloge de Malebranche, dans le tom. I. de ses *Eloges des Académiciens*, *A la Haye*, 1731, p. 317.

NIC. MALEBRANCHE, *De la Recherche de la Vérité*, *Paris*, 1673, 12mo.; seventh edit. 1712, 2 vols. 4to., or 4 vols. 12mo. In Lat. by LENFANT, *De Inquirenda Veritate*, *Genev.* 1691, 4to.; 1753, 2 vols. 4to.

332. Nicole Malebranche<sup>f</sup>, one of the Fathers of the Oratoire, whose disadvantageous person concealed a profound genius, and indisputably the greatest metaphysician that France has produced, developed the ideas of Descartes, and imparted to them a fresh originality, and greater clearness and vivacity: but his views of religion

\* CHRISTIAN WOLFF, for instance, and BAYLE; the first of whom has refuted the system of Spinoza in his † Translation of his *Ethics*, *Francf. and Hamb.* 1744, 8vo. See also JARIGES, quoted at the head of § 329. The dispute between Jacobi and Mendelssohn on the Spinozism of Lessing, was the occasion of a great number of writings respecting the tenets of Spinoza. See the same section. The † Translation of the *Ethics* of Spinoza by EWALD (*Gera*, 1791—93, 8vo.), also contains a refutation of Spinozism, on the principles of the Critical system.

<sup>f</sup> Born at Paris 1638; died 1715.

led him to superadd some tenets of his own inclining to mysticism. He has been peculiarly successful in discussing the theory of knowledge, the sources of error, (especially those which have their origin in illusions of the Imagination), as well as in his examination of the proper Method for the investigation of Truth. He described the understanding as *passive*; maintained *extension* to be the characteristic of Body; the soul to be an essence simple in its nature, and therefore distinct from its body; and represented the Deity as the only source of all thought and all existence. These opinions led him to controvert, by acute arguments, the doctrine of Innate Ideas, and gave rise to the extraordinary assertion, that it is *in* and *through* the Divinity that we apprehend all things, which are comprehended *intellectually* in His essence; that the Divinity is the Intellectual World; Infinite and Universal Reason, and the abode of Spirits: in these respects making near approaches to Spinozism. The doctrine of Occasionalism (which he enlarged and extended) is closely connected with such speculations; by which he was farther led to assign to the Soul and Body a sort of Passive activity, and to represent the Deity as the original cause of all their operations: a species of *Idealism*, half religious and half mystical. We may trace in it the consequences of a blind devotion to Demonstration, as the only method of attaining Truth. The *Abbé Foucher*<sup>s</sup> opposed to his system one of scepticism.

<sup>s</sup> SIMON FOUCHER, Critique de la Recherche de la Vérité.

Among the authors who discussed and opposed the theory of Malebranche, we may mention FATHER DU TERTRE (who did not understand it): Réfutation du nouveau Système de Métaphysique composé par le Père Malebranche, Paris, 1718, 3 vols. 12mo.; and ANT. ARNAULD: Des Vraies et des Fausses Idées contre ce qu'enseigne l'Auteur de la Recherche de la Vérité, Cologne, 1683, 8vo. To the latter work Malebranche replied by his: Réponse de l'Auteur de la Recherche de la Vérité au livre de M. Arnauld, des Vraies et des Fausses Idées, Rotterdam, 1684. Défense de M. Arnauld contre la Réponse au livre des Vraies et des Fausses Idées, Cologne, 1684, 12mo.; Trois Lettres de l'Auteur de la Recherche de la Vérité, touchant la Défense de M. Arnauld contre la Réponse, Rotterd. 1685, 12mo. The dispute was prolonged in some other writings; by LOCKE, in the second vol. of his Miscell. Works,

*Michael-Angelo Fardella*<sup>b</sup>, in his *Logic*<sup>i</sup>, employed in the defence of Idealism the same arguments which had been used by Malebranche, namely, that the existence of the material world is incapable of demonstration, and can only be maintained on the grounds of religious belief.

#### IV. *Supernaturalists and Mystics of this period.*

333. The dissensions of the Empirical and Speculative Schools, brought once more upon the stage the opposite factions of the Supernaturalists, the Mystics, and the Sceptics. Among these by far the most distinguished was *Blaise Pascal*; who, in consequence perhaps of his early devotion to Mathematics, imbibed a distrust of philosophical speculation, and in the latter part of his life, when his bodily sufferings increased, devoted himself to a sort of asceticism. *Theophilus Gale* (Galeus) was a thinker of a different stamp. He was a presbyterian minister<sup>k</sup>, and maintained that all true philosophy is contained in the revealed word of God, made known immediately to the Jews, and from them at various epochs and in various ways, derived to other nations. Consequently, philosophy is subordinate to theology. He recommended for these pursuits the study of the Neo-platonic writers<sup>l</sup>. *Ralph Cudworth*<sup>m</sup> pursued the same system, but (with greater originality) turned it against the Materialists and Atheists, in defence of Revealed Religion. He collected proofs of the existence of God (Syst. c. V. § 101—102), and of the Creation out of Nothing; and maintained the doctrine of an Intellectual system of know-

ledge, founded on Innate Ideas, according to the views of Plato. The *Plastic Nature*<sup>a</sup>, which he supposes may account for the conformity of created things to their uses, is nothing more than the *intellectual world* of Plato; to make room for which he denies the existence either of blind chance, of mechanical necessity, or of an immediate and continual creation on the part of God. He reproached Descartes for having excluded from Physics the doctrine of Final Causes. He derives the principles of Moral Good and Rectitude from certain *Moral Ideas*, which are copies of the Divine Wisdom, and not from notions acquired by experience<sup>o</sup>: on many other points also, adopting the principles of Plato. *Henry More*<sup>p</sup>, a member of the same university, followed the same line of argument. He was a learned man, and of an acute understanding, who finding the Peripatetic system insufficient to satisfy his doubts, which had carried him so far as to question his own Individuality, embraced the Neoplatonic theory, borrowed principally from the works of Ficinus, studying also the Cabbalistic writings; which he defended in several of his compositions, but without moulding these different materials into an uniform system (see § 321). He derived all philosophical knowledge from intellectual intuition, and maintained that all the truths of philosophy are deducible from Revelation, and have reference to Man and his destiny. In his metaphysics—the subject of

which is Immaterial nature—he endeavoured to establish the existence of an immoveable space, distinct and separate from moveable matter; and affected to deduce from this principle the laws of all motion, and of all matter liable to motion. He attributes to this space a real existence, and even some of the attributes of the Deity; describing it as the universal circumscription of the Divine presence. He maintains that the nature of the souls of men and other animals is simple, but supposes them to possess a certain *extent*. He pointed out the faults of the systems of Descartes and Spinoza, at the same time expressing great respect for their talents. In Ethics he blended the principles of Aristotle and Plato. The contemporary of the two former, *Sam. Parker*<sup>q</sup>, bishop of Oxford, criticised the atomistic theory of Descartes, and his proof of the existence of the Deity; and defended theology (whence he derived his proofs of the existence of God) against Atheism<sup>r</sup>. The physician and preacher *John Pordage*<sup>s</sup>, declared himself the advocate of a mystical Supernaturalism. He endeavoured to systematize the theosophic enthusiasm of *Jacob Böhm* (see § 321), and pretended to have been assured of the truth of his reveries by special revelation<sup>t</sup>. His pupil *Thomas Bromley*, disseminated the same notions. In France, *Pierre Poiret*, originally a Cartesian (§ 328), devoted himself altogether to a mystical supernaturalism, which denied to the mind all independent agency; and declared war against speculative philosophy<sup>u</sup>.

<sup>q</sup> Died 1688.

V. *Sceptics.*

334. Scepticism was propagated in France by two disciples of Le Vayer, *Simon Sorbière*<sup>†</sup> and *Simon Foucher* (§ 332). The first translated the Sketch by Sextus Empiricus of the Pyrrhonian philosophy (§ 151, bibliogr.). The latter employed himself upon the history of the Academic system (see at the head of § 166), and opposed Scepticism to the speculations of Descartes and Malebranche. On the other hand appeared, as opponents of Scepticism, *Peter Mersenne*<sup>‡</sup>, *Martin Schoock* (§ 327)<sup>§</sup>, and *Jean de Silhon*<sup>¶</sup>. In England the preacher *Joseph Glanville*<sup>‡</sup> endeavoured to moderate by a degree of Scepticism the unbounded extravagancies of Dogmatism, (particularly of the Aristotelians and Descartes), with the hope of promoting the cause of philosophy<sup>¶</sup>. He enlarged with ability on the causes of doubt, and applied them to the different departments of science; more particularly, the discoveries in physics effected in his own time. His remarks on causality, in which he coincides with those of Algazel (§ 256) and appears to have forestalled Hume, deserve especial attention. We do not, says he, detect the existence of any cause by intuition, nor immediately, but by reflection and therefore by inference, which may be erroneous<sup>¶</sup>.

<sup>‡</sup> JOS. GLANVILLE, *Scepsis Scientifica*, or Confessed Ignorance the Way to Science; in an Essay of the vanity of dogmatizing and confident opinion. With a reply to the exceptions of the learned THOMAS ALBIUS, Lond. 1665, 4to. *De Incrementis Scientiarum inde ab Aristotele ductarum*. Lond. 1670. HENR. STABIUS has published a Dissertation in answer to the latter work.

<sup>¶</sup> *Scepsis Scient.*, p. 142.

*Jerome Hirnhaym*<sup>c</sup> also allied Scepticism to Supernaturalism. Declaiming with considerable ability against literary presumption, and the arrogance of the learned, and maintaining that all knowledge is delusive, and that every axiom (so esteemed) of Reason had been annulled by Revelation, he insisted that Revelation from God, Supernatural Grace, and an internal Divine illumination, are the only true sources of certain knowledge. His Scepticism led him to recommend an enthusiastic Asceticism.

It may be remarked in general, that about this period Scepticism was called in to support the Catholic religion, whose advocates endeavoured by the use of it to recall Protestants to the pale of the church.

CHRISTIAN GOTTWALD WABST, Diss. (resp. Jo. GODFR. MÜLLER) Jo. Lockii de Ratione Sententias Excudit, Viteb. 1714, 110.

335. John Locke, (born at Wrington near Bristol, 1632; died 1704), renounced the intricacies of Scholastic philosophy for the more congenial study of the classics. The writings of Descartes inspired him with fresh ardour, particularly for the cultivation of Medicine and Metaphysics. He rejected indeed many of his master's notions, more particularly that of Innate Ideas; but was not the less captivated by his love of perspicuity and distinctness. The endless disputations of the learned led him to suspect that they had their origin in an improper use of words and want of precision in our ideas; which he proposed to rectify by ascertaining the grounds and extent of human knowledge, through investigation of the properties of the human understanding. This was the origin of his renowned work by which he justly acquired the greatest distinction for the modesty and tolerance of his way of thinking, and the clearness and rectitude of his understanding, evinced in the course of a correspondence with the most accomplished men of his day. He so far adopted Bacon's principles that he pursued the method of experiment and observation, in preference to that of speculation; applying it principally to metaphysical subjects. His method has many advantages, but at the same time some great defects; especially that of avoiding the great obstacles and difficulties in the course of science instead of directly encountering them. Notwithstanding, the opposition which he encountered was not so much the consequence of this radical fault, as of certain deductions from his system. (See § 333 note, and 337 note). By his treatises on Toleration and Education, Locke has rendered indisputable and undisputed services to mankind.

336. Locke's great object and merit, was the investigation of the origin, reality, limits, and uses of knowledge.

He contested the hypothesis of Innate Ideas, throwing great light on one side of the question, and endeavoured to prove by an induction which was necessarily incomplete, that all our notions are acquired by experience. The two ultimate sources of all our knowledge are the Senses and Reflection (or the perception of the operations of our minds); which has caused his system to be called one of Sensualism; since he gives even to Reflection the appellation of an Internal Sense. Our ideas are partly simple, partly compound: among the first are those of Solidity, Space, Extension, Figure, Motion, Rest: those of Thought and Will: those of Existence, Time, Duration, Power, Enjoyment, and Pain. Our simple ideas have an objective, or absolute and independent reality. The soul, like a piece of white paper (*tabula rasa*), merely receives their impressions, without adding any thing thereto of her own. They represent partly primary, partly secondary qualities or properties: among the first are Extension, Solidity, Figure, Number, etc.: among the latter, (which are *deduced* and *derived* as the first are *direct* and *original*),—Colour, Sound, Scent. Compound ideas are deduced from simple ones by an operation of the mind, for instance by Connection, Opposition, Comparison, or Abstraction. The ideas so acquired are those of Accident, Substance, and Relation. The understanding either applies Experiment and Observation to the formation of compound ideas, or by a totally different course, develops simple and absolute ones, such as those belonging to Mathematics and Ethics.

Locke has also suggested some admirable ideas on Language, and the abuses to which it is liable.—He defines knowledge to be the perception of the Connection and Agreement or the want of Connection and Disagreement of certain ideas, which may be deduced from four sources; Identity or Discrepancy—Relation—Co-existence or necessary connection, and Real Existence<sup>d</sup>. As relates to the *mode* of this perception, knowledge becomes either

<sup>d</sup> Essay, B. IV. ch. I, § 1—3.

Immediate or Mediate : Immediate, if the result of intuition, and Mediate if produced by demonstration: to these must be added a third class relating to particulars ascertained by *sensible* proof. It must be remarked, however, that his observations on the limits and use, etc. of knowledge do not penetrate far enough, nor, by any means, exhaust the question; he may even be said to have pronounced judgment against the reality of knowledge, before he had detailed his theory on the subject. His reasoning is far from being satisfactory on the subject of the principles of thought and knowledge, all of which, (even that of contradiction), he describes as *derived* and secondary. His analysis only embraces the material, without extending to the formal part of knowledge; and unravels only a few of the least intricate of our compound ideas. He deduces all knowledge from experiment, yet nevertheless proposes to support and confirm the latter by various inadequate proofs; and in this manner he maintains the possibility of a demonstrative knowledge of the Existence of God\*, and the Immortality of the Soul; and endeavours to erect a system of Metaphysics on the sandy foundation of experimental knowledge.

337. It was the object of Locke to liberate philosophy from vain disputations and unprofitable niceties; but his work had the effect of discouraging, by the facility and accommodating character of its method, more profound investigation; at the same time that he gave a *popular* air to such inquiries, diminishing the interest they excited, and affording advantages to Ecclecticism and Materialism. In Morals he adopted the principles of Experiment and a theory of Eudæmonism†. On the other

\* In Books IV. X. he develops his *Cosmological* proof.

Two inconsiderable works in answer to Locke were published by HENRY LEE (*Anti-Scepticism*) and by JOHN NORRIS, *Lond.* 1704, 8vo. That by BP. BROWN: *The Procedure, Extent, and Limits of Human Understanding*,

hand his system promoted the knowledge of Metaphysics on the grounds of Experience, and contained a variety of admirable rules relative to *Method*, as well as many valuable hints on points up to that time neglected. His theory gained a great number of adherents in England, France, and the Netherlands, where *J. Le Clerc* and *Gravesande* embraced his principles. Thence it gradually extended its influence into Germany. A great number of eminent men became his partisans, and deduced from his Experimentalism its direct or remote consequences, such as the hypothesis of a peculiar sense for the apprehension of Truth in matters of speculation and practice (Reid, Beattie, Rüdiger); the attempt to establish the *objective* Reality of knowledge, (Condillac, Bonnet, D'Alembert, Condorcet); the analysis of the faculties of the Soul, (Hartley, Condillac, Bonnet); the farther development of excellent rules for the investigation of Truth, (Gravesande, Tschirnhausen); an inadequate view of Metaphysics considered as nothing more than Logical reasonings on given facts (Condillac); the increase of Materialism and Atheism (La Métrie, *Système de la Nature*; and Priestley); and lastly the conversion of Morality into interested calculation (La Rochefoucauld, Helvetius).

† MACLAURIN, *Statement of the Discoveries of Newton*, 1748: translated into Lat. by GR. FALCK, *Vienna*, 1761, 4to.

338. The tendency in favour of Experimental philosophy, which had already become prevalent in England, was confirmed by the authority of Newton<sup>b</sup>. This illustrious philosopher, whose great discoveries in Physics, (e. g. the theory of Colours and the laws of Gravitation), achieved by the calm prosecution of experimental observations, naturally inclined him to recommend to others the same career, was so far from giving any encouragement to hypothetical speculation, that he made it his maxim, that "Physics should be on their guard against Metaphysics." Nevertheless he himself occasionally indulged in such inquiries; for instance, when he suggested that Infinite Space, in which the celestial bodies revolve, might possibly be the *sensorium* of the Deity. He supposed the existence of certain properties inherent in bodies—e. g. that of weight in atoms—and even presumed that when Natural Philosophy should have completed her course of Experiment, she might contribute to the perfection of Moral Philosophy; inasmuch as a more adequate knowledge of the First Great Cause, and of our relations to Him,

<sup>b</sup> Born at Wolstrop in Lincolnshire 1642; Professor of Mathematics at Cambridge 1669; died 1727.

may assist us in acquiring a fuller sense of our duties towards Him<sup>1</sup>.

### III. *English School of Moral Philosophy, and Reaction excited against the Empiricism of Locke.*

339. A school was formed in England, whose object was to establish the principles of Moral Philosophy on the basis of natural reason, and who to this end adopted the experimental method of Bacon. They sought for our first ideas of moral obligation not in the Understanding itself but in a peculiar and separate sense, (*Moral Sense*); inasmuch as it is by the senses that we acquire all knowledge of real objects. With the desire of opposing the selfish system of Hobbes (see § 316), and with the hope of exposing some of his inconsistencies, *Richard Cumberland*<sup>k</sup> endeavoured to establish the existence of a principle totally different—of Benevolence towards man and devotion to God; and proceeded to prove by reasoning that such a principle was the legitimate foundation of all our duties and of our highest happiness<sup>1</sup>.

These new views were carried still farther by a memorable character—*Antony Ashley Cooper, Earl of Shaftesbury*<sup>m</sup>; the friend of Locke, but whose penetration detected the consequences which might be deduced from a system of exclusive Experimentalism (see § 337). He made virtue to consist in the harmony of our social and selfish propensities, and in the internal satisfaction which is the result of disinterested actions, accompanied necessarily by the happiness of the individual<sup>n</sup>. Like Plato he was inclined to identify the Beautiful and the Good.

Examination of the notion of Moral Good and Evil advanced in a late book entitled: *The Religion of Nature Delineated*, by JOHN CLARKE, Lond. 1725, 8vo.

J. M. DRECHSLER, *On Wollaston's Moral Philosophy*, Erlang. 1801, and 1802, 8vo. second edition.

<sup>p</sup> We may here refer to many writings which arose out of a dispute on the Immateriality of the Soul, between WILLIAM COWARD, a physician, who denied it in several works (from 1702 to 1707), and his opponents J. TURNER, J. BROUGHTON, etc. To these may be added the controversy excited by H. DODWELL, who had maintained that it was mortal.

<sup>q</sup> Born at Norwich 1675;—the pupil of Newton—died 1729.

<sup>r</sup> In opposition to the opinion of Dodwell, already referred to, he endeavoured to deduce the doctrine of the Immortality of the Soul from our ideas of Immaterial existence: *A Letter to Mr. Dodwell*, wherein all the arguments in his *Epistolary Discourse* against the Immortality of the Soul are particularly answered, etc. Lond. 1706, 8vo. The noted Freethinker ANT. COLLINS, (a disciple of Locke, born at Heston 1676; died 1729), pointed out the defects of this answer in his *Letter of the learned Mr. H. Dodwell*, containing some Remarks on a pretended demonstration of the Immateriality and natural Immortality of the Soul in Mr. Clarke's Answer to his late *Epistolary Discourse*, Lond. 1708, 8vo., which gave occasion to several writings exchanged between Collins and Clarke. See the collection mentioned in bibliogr. § 346, and, *Philosophical Inquiry concerning Human Liberty*, Lond. 1715; with Supplements, 1717, 8vo. etc.

Clarke's Natural Theology is contained in his various Sermons, under this general title: *A Demonstration of the Being and Attributes of God*, Lond.

connection between natural and revealed religion, Clarke endeavoured to prove, by a new method, the existence of God. He described the Deity as the subject or *substratum* of infinite space and time, and asserted that space and time were His accidents: alleging some insufficient reasons for moral free-will; and sinking virtue into a compliance with *propriety*<sup>a</sup>. On the other hand, the Scepticism of Bayle induced the archbishop of Dublin, *William King*<sup>t</sup>, to publish a system of Divine Justice, prior to that of Leibnitz; which was republished under another and more extended form by *John Clarke* (the brother of Samuel), who did not hesitate to make Self-love the principle of Virtue<sup>u</sup>. The naturalists *John Ray*<sup>x</sup> and *William Derham*<sup>y</sup> took part in these disputes by publications half physical and half theological. *Collier*<sup>z</sup> and

*Berkeley*\* followed a course completely different. The last, in particular, a profound and judicious thinker, animated by a spirit of genuine benevolence, and venerable for his personal character, was shocked by the evil consequences which the prevailing theory of Experimentalism had produced. He was led to imagine that the fruitful source of all such aberrations was the unfounded belief in the reality and existence of the external world; and adopted a system of absolute *Idealism* as the only means of correcting such hallucinations. Berkeley has evinced no little sagacity in the arguments he adduces to show the difficulties attendant on the ordinary belief, and the obscurity of our ideas of Substance, Accident, and Extension; maintaining that our senses convey to us none but sensible impressions, and do not afford us any proof of the existence or substantiality of their objects; and that consequently the existence of an external world independent of our sensations may be nothing more than a Chimæra. Consequently none but Spirits exist: man can contemplate nothing but his sensations and ideas; but as he certainly is not the cause to himself of these, it is no less certain from their multiplicity and variety, as well as their harmony and consistency, that they are communicated by a Spirit, (as none but spirits exist), and by a Spirit of infinite perfections—God. Though dependent on God for knowledge, man is nevertheless endowed with absolute free-will, and the cause to himself of his own

errors and crimes. Collier's work never attained the celebrity enjoyed by the elegant dialogues of the Bishop of Cloyne, but both, with a laudable wish to preserve from decay the elements of natural Ethics, alike attempted to demonstrate the necessity of Idealism, on principles first advanced by Malebranche; and trusted that they had destroyed to the root Scepticism and Atheism. Their doctrines, however, had little influence over the fortunes of the English School of philosophy.

Berkeley's remarks on the Theory of vision are also of interest.

341. The system we have referred to (§ 339), of *Benevolence*, was more fully developed by a new philosopher. *Francis Hutcheson*<sup>b</sup>, who has been looked upon as the founder of the Scottish School, placed in a still stronger light than his predecessors the contradiction existing between Self-love and Virtue. He allows the appellation of Good to those actions alone which are disinterested and flow from the principle of Benevolence. The last has no reference to expediency nor personal advantages, nor even to the more refined enjoyments of moral sympathy, the obligations of Reason and Truth, or of the Divine Will. It is a distinct and peculiar principle; a moral sentiment or instinct of great dignity and authority; and the end of which is to regulate the passions, and decide, in favour of Virtue, the conflict between the interested and disinterested affections. On this foundation Hutcheson erected all the superstructure of the Moral duties.

His inquiries are valuable also as tending to illustrate the principles of the Fine Arts.

LEECHMANN, *ibid.* 1755, 2 vols. 4to.

IV. *French Moral Philosophers.*

342. In France Moral philosophy took nearly the same *experimental* direction. The Jesuits having endeavoured to render popular the species of morality which favoured their ends by founding it on looser principles of obligation<sup>c</sup>, the fathers of the Oratoire or Port-Royal, *Arnauld*, *Pascal*, *Nicole*, *Malebranche* (§§ 328, 332, 333), opposed to theirs a rigid system of Ethics, but which, being occasionally mystical and enthusiastic, was not likely to be permanently established. François Duc de la Rochefoucauld<sup>d</sup> on the other hand painted human nature as he had found it; representing it as directed solely by Self-love; and supplying a convenient sort of Morality for the use of the most corrupted portion of the upper classes. *Bernard de Mandeville*<sup>e</sup> went so far as to assert that Virtue is nothing more than the artificial effect of Policy and Ostentation, and that private vices are public benefits: a detestable doctrine, which removed all fundamental distinction between right and wrong, justice and injustice<sup>f</sup>.

<sup>e</sup> He was born at Dort, 1670, of a French family, and lived in London, where he practised as a physician. Died 1733.

<sup>f</sup> See his celebrated fable of the bees, which he published in 1706: *The Grumbling Hive, or Knaves turned Honest*. Eight years afterwards he published, with illustrations: *The Fable of the Bees, or Private Vices made Public Benefits*, *Lond.* 1714. To defend his doctrine, he composed six dialogues, which form the second volume of the entire work in the edit. of 1728, and in those which followed. To these he added: *An Inquiry into the Origin of Moral Virtue*, sixth edit. 1732, 2 vols. 8vo. It has been already remarked, that the *Alciphron* of Berkeley is principally directed against this author. He was answered also by other writers, particularly by W. LAW: *Remarks upon a book: The Fable, etc.*, in a letter to the author, *Lond.* 1724; second edit. 1725. And (BLUET) *Inquiry whether a general practice of Virtue tends to*

V. *Sceptics of this Period.*

343. Scepticism had been employed by Nicole and by Bossuet<sup>s</sup>, and by several other writers, as the means of bringing back the Protestants to the pale of the Catholic Church; and of exalting its authority by setting forth the incertitude and fallibility of human reason<sup>h</sup>. Two individuals, however, of comprehensive and liberal minds, undertook still farther to defend the cause of Scepticism for its own sake. The first was the prelate *P. Dan. Huet*<sup>i</sup>, one of the most learned men of his day, and versed in almost every department of Science. He had in his youth embraced the Cartesian system, but became dissatisfied with it on studying the work of Empiricus (see § 327); and renounced Gassendi's theory, because adverse to religion. In this manner he fell into philosophical Scepticism, which in his later writings he made public. He admits that Truth must doubtless exist, but asserts that it can be known only to God. The Human understanding has so many obstacles to encounter in its progress towards knowledge, that it cannot hope to attain it, nor can it be assured of the complete correspondence of its perceptions with their objects. *Faith* alone can impart certainty, but this is not attainable on Sceptical principles,

because it does not spring from Reason, but from a higher principle, and has reference to a Truth absolute in itself, and the subject of a distinct revelation.

*Pierre Bayle*<sup>k</sup> appears not to have been so intimately convinced as Glanville (§ 334) of the possibility of a True Philosophy, although he contributed more than the other had done to open a way to the discovery of it, by his ingenious attacks on the Dogmatic Systems, and by showing that Scepticism cannot be the ultimate end of our inquiries. This great scholar and honourable man possessed not so much a profound spirit of philosophical research, as a quick sagacity and critical judgment. These talents, improved by extensive reading (particularly of Plutarch and Montaigne) and the study of the various philosophical systems and religious tenets of his time, had the effect of forming in him a sceptical way of thinking, and encouraging a spirit of historical criticism, of which up to that time there had been no example. He was born at Carlat in the county of Foix, 1647, his father being a reformed minister, and after many vicissitudes which befel his party in the Church, held a professor's place at Sedan, and afterwards at Rotterdam (1681); became embroiled in many controversies, and died in a fortunate state of independence A. D. 1706. He was a quick-sighted spirit, who employed against Prejudice, Error, and Dulness, but still more against Superstition and Intolerance, the arms of a lively wit, various learning, and equal acuteness. At first he embraced the Cartesian system, but having compared it with others, and accustomed himself to Sceptical discussions, he ceased to

confide even in the possibility of knowledge, and brought himself to believe, *That Reason was clear-sighted enough to detect error, but not sufficiently so, without external aid, to attain to Truth.* In short, that without a Revelation from above she cannot but err. With such views he applied himself constantly to detect the weak sides of every sect and system, which nevertheless had had their supporters: particularly insisting on the difficulties which belong to the questions of the attributes of the Deity,—Creation—Providence—Evil, Moral and Physical—Immateriality—Free-will, and the reality of our knowledge of an external world. At the same time that he availed himself of Revealed Religion as a beacon in the discussion of such subjects, he did not fail to point out whatever, in the Christian doctrine or morals, he chose to consider at variance with Reason; stimulating the minds of men to inquiries still more sceptical. In his discussions on Providence carried on with *Jean Le Clerc*<sup>1</sup> (§ 337), with *Isaac Jacquelot* (§ 331), and with *Leibnitz*, on the origin of Evil (§ 350), and others, he always preserved the calmness and dignity of a philosopher. His works have greatly contributed to the dissemination of knowledge, and unfortunately also to the propagation of an unsettled spirit of free-thinking. *Jean-Baptiste de Boyer, Marquis d'Argens*<sup>m</sup> also appeared as a Sceptic.

<sup>1</sup> LE CLERC wrote in answer to Bayle: *Défense de la Providence contre les Manichéens, dont les Raisons ont été proposées par M. Bayle dans son Dictionnaire Critique* (dans le t. I, des *Parrhasiana*, p. 303). This work is composed on the principles of Origen. Le Clerc also undertook the defence of Cudworth's System, especially of his hypothesis of *Plastic Natures*: the discussion produced a multitude of writings on both sides, and finally led Le Clerc to accuse Bayle of Atheism.

JACQUELOT attacked the theological opinions of Bayle in his work, *Conformité de la Foi avec la Raison, ou Défense de la Religion contre les principales Difficultés Répandues dans la Dictionnaire Historique et Critique de M. Bayle*, Amst. 1705, 8vo. Bayle replied to him in his, *Réponses aux Questions d'un Provincial*. Jacquelot then published an *Examen de la Théologie de M. Bayle*; and the latter rejoined by, *Entretiens de Maxime et de Thémiste, ou Réponse à l'Examen de la Théologie de M. Bayle, par M. Jacquelot*. This work appeared at Rotterdam in 1707, after the death of the author. Jacquelot replied to it by another.

<sup>m</sup> Chamberlain of Frederick the Great; died at Aix, his native town, 1770.

The Sceptical School was attacked, but not overcome, by *P. de Villemandy*<sup>n</sup>, *J. P. de Crouxaz*<sup>o</sup>, and *Formey*<sup>p</sup>.

### PROGRESS OF PHILOSOPHY IN GERMANY.

#### *Pufendorf.*

344. About the middle of the seventeenth century philosophy acquired in Germany renewed energies, though these were at first confined to a limited sphere. *Samuel Fr. Baron von Pufendorf* reduced Natural Law to the forms of a science. He was born 1632, at Flöke, near Chemnitz; and having studied the Cartesian philosophy at Jena, became in 1661 professor of the Law of Nature and Nations, at Heidelberg, afterwards at Lund, and died historiographer of the House of Brandenburg, at Berlin, 1694. He attempted to reconcile the opinions of Hobbes and Grotius, and discussed Natural Law as a separate question, independent of the obligations of Revealed Religion or Positive Civil Law. The philosophers of the Theological school became in consequence his enemies; particularly Valent. Alberti and Joachim Zentgrave.

Pufendorf first gave a currency to the principle of Sociability, which Grotius had started; and maintained that in virtue of this motive, which is allied to Self-love, man desires the society and co-operation of his fellow-men; but that at the same time through the corruption of his nature, (the state of Nature described by Hobbes), and in consequence of the multiplicity of his desires, and the impossibility of easily satisfying them, as well as the instability of his natural disposition, he is no less inclined to do injury to others, and is furnished with the means of doing so in his address and cunning. From these

<sup>o</sup> See the works mentioned § 124.

<sup>p</sup> Ibid.

considerations he infers, on the principle of Self-love, the first law of society, that we should each individually labour to maintain the social compact, which derives its authority directly from God, as the Creator of mankind. From this origin Pufendorf deduces the laws of Morality and Jurisdiction. He does not indeed discriminate between Natural and Moral Right, and frequently recurs to Christianity for positive precepts; yet he may be said to have laid the foundations of an Universal philosophy of *practice*. The multifarious disputes in which he was engaged, particularly with Alberti (§ 315), were of little service to the cause of philosophy. He has perhaps been as much encumbered by his commentators as his adversaries.

A Life of Leibnitz, by REHBERG, is to be found in the † *Hannoverian Magazine*, 1787, year 25 ; and another among the † *Lives and Characters of distinguished Germans*, by KLEIN, 1 vol. ; as well as a third in the † *German Pantheon*, by EBERHARD.

345. The comprehensive genius of *Gottfried William Leibnitz* embraced the whole circle of philosophy, and imparted to it, in Germany at least, a new and powerful impulse. All that can interest or exercise the understanding was attempted by his great and original mind, more especially in the Mathematics and Moral Philosophy. He was ignorant of no one branch of learning, and in all he has shown the fertility of his mind by the discoveries he suggested or attempted. He was the founder of a school in Germany which distinguished itself for the solidity of the principles it embraced, and the systematic manner in which these were developed—a school which effected the final overthrow of the Scholastic system, and extended its influence over the whole range of the sciences. Leibnitz, by his example and his exertions, laid the foundations of this great revolution, by combining the philosophical systems which had prevailed up to his time: by his extraordinary learning: the liberality of his mind: and that spirit of toleration which led him always to discover some favourable point of view in what he criticised—something, even in the most obscure systems, which might suggest matter for research. To this must be added the harmony which prevailed in his own system, and the infinitude of bright ideas, hints, and conjectures, which were perpetually, as it were, scintillating from his brilliant mind, though he left to others the task of collecting and combining them.

He was born June 21, 1646, at *Leipsic*, where his father was professor of moral philosophy, and studied the same science under J. Thomasius (born 1622, died 1684), applying himself at the same time to the Mathematics<sup>p</sup>

<sup>p</sup> Under Erh. Weigel, at *Jena*, (who died 1690).

and the study of Natural Law; read the Classics in the original tongues, particularly Plato and Aristotle, whose doctrines he endeavoured at an early age to combine. The cultivation of his mind was advanced, and the versatility and address of his natural parts promoted, by immense reading and a multifarious correspondence: by his early independence of mind: by his travels, particularly to Paris and London: and by his acquaintance with the most distinguished statesmen, and most illustrious sages of his time. He died, November 14, 1716, at Hanover, of which state he was a privy councillor, and keeper of the library; scarcely less honoured after his death than during his life, as is testified, among other things, by a monument recently erected to him.

Leibnitz was led to the composition of his philosophical system by various causes; by the acute comparison he was induced to make of the most celebrated of former systems with a reference to the exigencies of his own time; by a capacity fruitful in ingenious hypotheses and in improvements or accommodation; as well as by his great mathematical acquirements. His object was so completely to reform Philosophy that it might possess a strictness of demonstrations analogous to that of the Mathematics, and to put an end to all disputes between its factions, as well as all differences supposed to exist between it and Theology<sup>a</sup>; with the hope of diminishing the principal difficulties belonging to some great questions, and, at the same time, the causes of dispute by improving the *method* of philosophy, and ascertaining, if possible, some positive and invariable principles. It was

<sup>a</sup> Discours de la Conformité de la Foi avec la Raison (in the Théodicée.)

his opinion that the same course should be pursued as in the Mathematics, which led him to prefer the method of Demonstration and the system of Rationalism; such as it had been embraced by Plato and Descartes; without entirely concurring with either. The *method* thus adopted induced him to appreciate even the labours of the Schoolmen. *There are certain necessary Truths* (such was his opinion), *belonging to Metaphysics as well as Mathematics, the certainty of which cannot be ascertained by Experiment, but must be sought within the Soul itself.* This is the corner-stone of the Rationalism of Leibnitz; who endeavoured to liberate the Cartesian system from its attendant improbabilities; without, however, effecting any accurate discovery of the principal conditions of philosophical knowledge, or any complete definition of its method or limits. The Rationalism of Leibnitz is especially apparent in his Theory of Knowledge, essentially opposed to that of Locke. Leibnitz interested himself in the investigation of the possibility of a *Characteristic* or Universal Language: which might represent the discoveries in Art and Science in the same way that arithmetical and algebraic signs express the proportions of numbers. (*Œuvres Philosophiques*, p. 535, sqq.; *Princip. Philos.* § 30, 33, 35, 37).

347. According to Leibnitz necessary Truths are innate: not that we are from our birth actually conscious of them, but are born with a capacity for them. Our perceptions however differ by being clear or obscure, distinct or confused. *Sensible* perceptions are indistinct; *all precise knowledge being the property of the understanding.* The criterium of Truth, which Descartes laid down (§ 325) is inadequate: the rules of Logic, which are the same in substance with the laws of the Mathematics, are more appropriate to the purposes of Philosophy. All our conclusions must be founded on two grand principles: 1st. That of Identity and Contradiction. 2ndly. That of a Sufficient Cause. These two principles are as applicable to necessary as to contingent truths. Necessary

truths are discoverable on the principle of Contradiction, by the analysis of compound objects into their simple elements: accidental truths, on the other hand, are ascertained by virtue of the Sufficient Cause, which conducts us to an ulterior and independent truth, beyond the range of what is contingent<sup>r</sup>. The ideas which relate to objects *without* the soul, must have a correspondency with such objects; otherwise they would be mere illusions. The ultimate ratio of innate and necessary truths resides with the Deity, as the source of all necessary and absolute Truth, which is dependent on the Divine Understanding (not the Divine *Will*.)

LEIBNITII Meditationes de Cognitione, Veritate et Ideis; in the Acta Eruditorum, 1684.

Nouveaux Essais sur l'Entendement Humain par l'Auteur de l'Harmonie pré-établie; in the Œuvres Philosophiques, published by RASPE.

348. His *Monadologia* is the central point of the system of Leibnitz, by which he believed himself to have ascertained the ultimate grounds of all knowledge. Plato's theory, and possibly the notions of the physician *Francis Glisson*<sup>s</sup>, led him to these speculations, by which he also believed himself to have found a way of reconciling the Aristotelian and Platonic systems. Experience proves to us the existence of compound objects; consequently, we are led to believe in the existence of *simple* ones (*Monades*) of which the other are compounded<sup>t</sup>. Our senses cannot apprehend these, inasmuch as they present to us objects in their confused and compound state, the understanding alone contemplating them with precision. That which is Simple is the elementary principle of the Compounded, and as the former cannot be directly appre-

<sup>r</sup> Princ. Philos. § 31—46. Théodic. p. 1, § 44.

<sup>s</sup> Died 1677.

Tractatus de Naturâ Substantiæ Energicæ, s. de Vitâ Naturæ ejusque tribus facultatibus perceptivâ, adpetitivâ et motivâ auct. FRANC. GLISSONIO, Lond. 1672, 4to.

<sup>t</sup> Princip. Philos. p. 1.

hended by the Senses, it is multiplied and confused in our perceptions. The *Monades* cannot be influenced by any change from without, their principle of modification being internal to themselves, and inasmuch as all real substances must have their internal properties, by which they are mutually discriminated<sup>u</sup>, and as there is no other internal property but that of perception, it follows that the *Monades* are *Spiritual powers and faculties*, which are continually labouring to change their condition (or perceptions.) God is the *Monas Monadum*: The necessarily existing Essence. Every real essence is a *fulguration* from His; modified by the limited nature of the being in which it is contained. The Essence of God is absolute Perfection; it embraces all possible Realities without limitation; none of them conflicting with the rest. He is the absolute and sole cause of the *actuality* of the world and the existence of all things: the all-sufficient cause, unlimited by action or condition: the original source of all knowledge and being. There exists therefore an infinite and original or primordial Monade, and also secondary, finite, and limited Monades, which latter are distinguished from one another by the properties of their phenomena. Some Monades are without Perception (Inert bodies):—some possess it (souls):—some are endowed with an obscure consciousness (the inferior animals): some possess a clear and perfect one. Distinct perceptions are the sources of Action: obscure and confused ones of Passion and Imperfection. Every simple substance, or Monade, forming as it were the Central-point of a compound substance (for instance that of an animal), is the nucleus of an infinitude of other Monades, which constitute the external body of the first; and agreeably to the affections of these aggregated Monades, the Central-Monade apprehends and, as it were, concentrates in it a common focus, the impressions of external objects. Furthermore, as

<sup>u</sup> "Because there cannot be two things which completely agree in their internal properties."

every thing in this world is connected with something else, and as all bodies affect others, and are themselves affected in the ratio of their respective distances, it follows that each individual Monade is a sort of *living mirror*, endowed with an internal activity of its own, enabling it to image forth the whole Creation, being itself constituted on the same principles as the Universe at large. There exists no immediate influence (*influxus physicus*) of one simple substance on another (e. g. Soul and Body), but merely an *ideal connection*: that is, the internal affections of each Monade harmonise with those of the Monades which are in immediate connection with the first. This gives them the appearance of being mutually influenced by each other. The cause of this correspondence is the infinite wisdom and power of God, who, at the first, so constituted all things, that there exists an universal—pre-ordained harmony, or *Harmonia præstabilita*<sup>\*</sup>. Space is the arrangement of all things simultaneously existing: the phenomenon of *Expansion* is the consequence of the confused manner in which such arrangement is represented by the senses; and Time is the order of successive changes which take place in the external world. Time and Space have merely an ideal and relative existence.

349. The Divine Intelligence contemplates an infinitude of *possible* worlds, from among which His wisdom and goodness have selected, and His power created *the best*, i. e. the world in which the greatest number of Realities exist and harmonise with each other. (A system of *Optimism*). Hence it follows that every thing is for the best, considered as a part of the universe with which it is connected, even although in itself it should be imperfect; nor can any thing be other than what it is<sup>7</sup>. Every thing is so constituted as to attain in the highest possible degree its own felicity, and to contribute in the greatest degree possible to the good of the Whole. The existence of Evil is no objection. Leibnitz distinguished Evil into Metaphysical—Physical—and Moral. Metaphysical evil is nothing but the necessary limitation of the nature of finite beings, the consequences of which are physical evil (e. g. pain), and moral (sin). Moral evil has its origin in the power of Choice intrusted to Finite beings. Freedom of will is not an Equilibrium or Indifference of inclination, nor yet a determination without a motive; but a free choice of one line of conduct in preference to others no less physically possible; influenced, but without constraint or necessity, by that, among many motives of action, which preponderates. It by no means interferes with this perfect freedom of election that God foresees all human actions, inasmuch as contingent and

<sup>7</sup> *Principia*, § lv—lx ; *Théodicée*, i, p. 8, 9.

free-will actions only exclude the hypothesis of absolute, not that of conditional necessity. Every thing in the world is *conditionally necessary*; yet man, not foreseeing the future, is bound to act according to his judgment and reason. In these respects Leibnitz studiously opposed the system of Descartes, whose hypothesis of absolute Fate deprived even the Deity of all real influence. God does not absolutely will or ordain either physical or moral evil; but he allows the first to exist as a necessary consequence of His general laws, and as means to ulterior ends; and permits also the existence of the latter, inasmuch as it is necessarily connected with the highest degree of perfection possible in the present world: His wisdom and goodness having established a harmony between the systems of Nature and Grace; in which consists the Divine Government of the world.

Leibnitz was led (as he tells us in his Preface to the *Théodicée*) to these speculations on the harmony between Revelation and Reason, by the doubts and objections of Bayle.

350. Leibnitz gives us but partial views of his Doctrine; not presenting it to us as a whole, but piecemeal. *Practical* philosophy he has touched upon but slightly. For the most part his system is the imperfect result of a great talent for analysis and combination; of great ability in reconciling the difficulties and differences presented by Philosophy and Theology; embracing a partial and incomplete investigation of the faculty of knowledge. As Locke had sought the foundation of all knowledge exclusively in the senses, so did he in the understanding; and asserted that it is by Thought that the existence of external things is ascertained (a system of Rationalism). He confounds Logical possibility and actuality with Real; makes all the phenomena of perception too completely intellectual; and overlooks the important part which observation must always support in the acquisition of knowledge<sup>a</sup>. If his system had been well founded it would have established an absolute Determinism; incompatible with the free agency of rational beings. Nevertheless, his philosophy, abounding in bold hypotheses and splendid observations, has promoted the cause of metaphysical science, by bringing into circulation a multitude of new ideas; to which the circumstance of his composing for the most part in French has contributed.

† Detailed Plan of a Complete History of Leibnitz, by C. G. LUDOVICI, *Leipz.* 1732, 2 parts, 8vo.

351. Leibnitz had a great number both of adherents and adversaries<sup>b</sup>: the former for a length of time labo-

<sup>a</sup> Consult: *De Principiis Juris Observationes*, 1700. *Anonymi Sententia de Tractatu cl. viri SAM. PUFENDORFII qui inscribitur de Officiis Hominis et Civis*; in a *Programma* of J. C. BÖHMER, 1709, 4to. † On Natural Law according to LEIBNITZ, see his Preface to *Corpus Juris Gentium*; and several of his Letters.

<sup>b</sup> BAYLE (for instance), in his *Dictionary*: LEIBNITZ replied by his: *Eclaircissemens des Difficultés que M. BAYLE a trouvées dans le Système nouveau de l'Union de l'âme et du corps*, *Journal des Savans*, 1698, and his *Histoire des Ouvrages des Savans*, 1698, p. 329; with: *Réponse aux Re-*

riously employed themselves in fortifying the outworks of their master's system; while the latter directed their attacks rather against the consequences of his philosophy than its principles. The result was an animated conflict, which kept alive the interest of philosophical research, and insensibly introduced the habit of more profound inquiries respecting the fundamental properties of human knowledge.

The system of Leibnitz, though favourably received by many distinguished professors, failed at first to obtain great influence in Germany, from its want of a systematic form. Other obstacles impeded its progress in France and England.

Among his successors we must distinguish *M. G. Hansch*<sup>c</sup>, and *Christian Wolf*, the most renowned advocate of this school, and the first who gave an extensive popularity to the system. He was succeeded by his pupils, *Bilfinger* and *Baumgarten* (§ 360.)

flexions dans la seconde édition de M. BAYLE, article RORARIUS, sur le Système de l'Harmonie pré-établie, dans l'Histoire Critique de la République des Lettres, tom. ii, et Recueil des Diverses Pièces, tom. ii, p. 389. SAM. CLARKE, and NEWTON also opposed Leibnitz. We have mentioned above (§ 346) the works which relate to their disputes, etc. The ABBÉ FOUCHER also wrote an article against his system of pre-established Harmony, in the Journal des Savans, année 1695, p. 638, sqq., to which Leibnitz replied in the same Journal, 1696, p. 255—259: LAMY attacked him in his Connaissance du Système, etc. tom. ii, p. 225, sqq. which was met, on the part of Leibnitz, by: Réponse aux Objections que le P. LAMY, Bénédictin, a faites contre le Système de l'Harmonie pré-établie, dans le Journ. des Sav., 1709, p. 593. We may add to the number of his opponents all who subsequently declared against the doctrines of WOLF; particularly PIERRE DE CROUZAZ (§ 357) in his Critique on Pope's Essay on Man, and in his Réflexions sur l'ouvrage intitulé: La Belle Wolfienne, Lausanne, 1743, 8vo. DE VATTEL defended against the last the system of Leibnitz, in his: Défense du Système Leibnitien contre les Objections et les Imputations de M. CROUZAZ, contenues dans l'Examen de l'Essai sur l'Homme, de Pope, Leyde, 1741, 8vo.

ciples as by the distinctions he made between the *Præcepta Justi—Honesti et Decori*; and by limiting Natural Right to merely negative principles of external conduct. His views in these particulars procured him, in after time, as much abuse from one set of philosophers as they obtained applause from another<sup>b</sup>. They were maintained in a more exact and methodical manner by *Ephraim Gerard*, and still more so by *Jer. Gundling*<sup>1</sup>. The principle of morality which Thomasius assumed was Reasonable Love, differing from unreasonable or Self-love; of which, after all, it was a modification. The fruit of this Reasonable Love or Desire, is Happiness or repose of mind, constituting the ultimate object and supreme good of man. His successors (Gerhard and Gundling), defined still more broadly the limits between Natural Right and Morality, and treated the former as a system of perfect right and corresponding obligation, having in view a State of Nature; at the same time frequently referring to the enactments of *positive* law, especially the Roman, to which a certain degree of authority was still allowed. *Heineccius*, *The Cocceii*, and *Pütter*, have treated Natu-

353. *Christian Wolf* was born at Breslaw, in 1679, and was formed to become one of the most profound philosophers of the Dogmatic School by the study of the Mathematics, of the Cartesian philosophy, and of the *Medicina Mentis* of Tschirnhausen. He was by nature possessed of less invention than powers of analysis, and talents for systemisation; with considerable powers of popular expression. These advantages he employed in the illustration and defence of the Leibnitzian system, with singular success. By his elementary works, in German, he completed the downfall of the Scholastic philosophy in the universities of Germany; to which Thomasius also contributed. He materially improved the habits of thought of his countrymen, by promoting their progress in science, and the cultivation of order, method, and systematic arrangement. In 1707 he became professor of Mathematics at Halle, and after a long controversy with his colleagues (among others with *J. J. Lange*, (§ 356), who accused him of Atheism), he was driven from his chair (1723), and retired to Marburg, where he taught

as professor of Moral Philosophy. He was honourably recalled to Halle (1740), by Frederic II.; and died there April 9th, 1754;—having outlived his reputation.

354. Wolf was the first philosopher who sketched out a complete Encyclopedia of the philosophical sciences, and, in a great measure, filled up his outline. He divides *speculative* philosophy into Logic and Metaphysics; of which Metaphysics comprehends Ontology, Rational Psychology (to be distinguished from Empirical), Cosmology, and Theology. *Practical* philosophy he subdivides into Universal practical Philosophy, Ethics, Natural Right, and Law, and Politics. These subdivisions of Moral Philosophy, with the addition of *Æsthetics*, or, the Theory of Taste, are at the present day generally adopted. As for the *matter* of his Philosophy, he found it for the most part supplied by others. He adopted the views of Leibnitz, with the exception of the perceptive faculties of the Monades, which he absolutely rejected, and of the Pre-established Harmony. He may be said to have given a new edition of the Leibnitzian system, under the form of a dogmatical Dualism<sup>m</sup>; and filled up some of the lacunæ it contained, either by the addition of new matter of his own, or a skilful development of his master's views. His chief merit consists in the unity of plan he has preserved, and the consecutiveness of his argumentation, which is the effect of a rigorous application of what is called the mathematical method, and which he declares to be nothing more than an exact adaptation of the laws of Logic. The improvements which Wolf thus brought about, consisted in a more exact arrangement, a clearer definition of ideas, and greater precision in the *language* of philosophy. The main defects of his system were, an affectation of demonstrating every thing, an exclusive attention to the principle of Thought, a neglect of the difference between the material

<sup>m</sup> A Dualism it will be remembered implies the recognition of two elementary principles.

and formal conditions of knowledge, and a disposition to exalt *contradiction* into an universal principle of all science. It must be added that he maintained it to be impossible to discriminate between ideas derived from the intellect and those acquired by experience; limited the operations of the mind to the mere perception of impressions; and in short, overlooked the characteristics which distinguish Moral Philosophy from the Mathematics, in respect of Form and Matter. His system led him to the construction of a number of useless and tedious formulæ, which could have no other effect but that of inspiring disgust and contempt for speculative researches in general, and particularly for those of Metaphysics. His theory, like that of Leibnitz, favours the doctrine of Determinism, or moral Fatalism.

355. Wolf chiefly distinguished himself by the accuracy of his scientific method, as applied to practical philosophy. He laboured to ascertain some fundamental principle, from which he might deduce the whole system of Practice, and connect its details with his general theory; which he was the first among modern philosophers to attempt. Such a fundamental principle he believed himself to have discovered in the idea of Perfection, and thought that experiment confirmed his observation. He defined those actions to be *good* which *perfect our condition*, i. e. produce or tend to produce an unison between our condition as it was, as it is, and as it will be; and *evil* those which produce the contrary effect, or are the causes of a discrepancy and discordancy in our state at different periods. Free actions are in a certain sense necessary also, and derive their qualities of evil and good from their consequences and results, and not from original distinction made by the Divine Will. Virtue consequently, the art of making perfect our condition. The grand rule of virtue is, *Perfice te ipsum*: do that which may perfect your own condition, or that of another, and avoid all that can render it imperfect. Reason suggests what will perfect or render imperfect our state,

and consequently, all moral good is dependent on knowledge, all moral evil the consequence of defective knowledge. The consciousness of our perfection, or approximation to perfection, bestows contentment: a state of contentment confers happiness; and the consciousness of a continued and uninterrupted progress towards perfection is the greatest happiness that can be enjoyed by man<sup>a</sup>. From these principles Wolf deduces the subordinate laws of Morals, of Natural Right (comprehending a general theory of Rights and Duties<sup>o</sup>), and of Polity with great apparent facility, and much display of detailed information. The unity and consecutiveness of his system gave it a prodigious advantage, to which must be added, the circumstance that he made the intellect the source of moral knowledge. Its faults were the vagueness of its leading idea, the difficulty of deducing from such a principle the obligations of morality, and the absence of an adequate *motive* for virtuous action; defects which the great abilities of many disciples of his school have not been able to palliate. In reality it is a system of Rationalism only in appearance, and from the want of a complete discussion of the question of moral consciousness, ends in one of Eudæmonism (§ 368). Nevertheless, some particular subjects have been treated by members of this school not unsuccessfully; particularly by *Thom. Abbt*<sup>p</sup>.

<sup>a</sup> For WOLF'S Works on Ethics see § 353; and J. AUG. EBERHARD'S *Sittenlehre*. See § 367, notes.

<sup>o</sup> In this respect he has been followed by most of the writers who have treated of Natural Law. BAUMGARTEN (§ 360) and H. KÖHLER alone reduced this subject to the narrow limits to which it had been confined by GUNDLING (§ 352).

The principal authors who have treated the subject with the views of Wolf, are: NETTELBLADT (§ 360), DARJES (§ 358), and the Jurist J. C. F. MEISTER, † *Rudiments of Natural Law, Francf. on Oder*, 1809, 8vo. The Eclectics HÖPFNER (died 1797), and ULRICH (died 1813), differed from this school only on minor questions.

<sup>p</sup> Born at Ulm, 1738; died 1766.

## ADVERSARIES OF WOLF, AND ECLECTICS.

356. Jealousy of Wolf, in addition to other more justifiable motives, raised up a formidable antagonist to his system in the person of *John Joachim Lange*<sup>q</sup>, who sounded the alarm against it, as a mass of Fatalism and Atheism, destructive alike of religion and government. His strictures presently excited the same apprehensions in other learned men, such as *Dan. Strähler*<sup>r</sup>, *J. Fr. Müller*<sup>s</sup>, etc. and brought about a decree against the publication of Wolf's doctrines in the Universities. The greater part of the adversaries of that philosopher were men of narrow minds, and prejudiced opinions; some few were actuated by more laudable motives, the desire of maintaining perfect freedom of discussion and hatred of party-spirit; but almost all directed their views only to the consequences of his system without ascending to its principles. A small number examined it with more enlarged views, and acquired a durable reputation, such as *Andreas Rüdiger* (following §), *J. P. de Crousas* (the same),<sup>†</sup> and more particularly *Chr. Aug. Crusius* (§ 358), and *J. G.*

<sup>q</sup> Born at Gardelegen 1670: professor of Theology at Halle, from 1709 to 1744.

LANGE*, *Causa Dei et Religionis Naturalis adversus Atheismum*, etc., *Hal.* 1723, 8vo. *Modesta Disquisitio novi Philosophiæ Systematis de Deo, Mundo, et Homine, et præsertim harmonia commercii inter Animam et Corpus Præstabilita*, *Hal.* 1723, 4to. (The author endeavours to demonstrate the agreement, in this particular, of the doctrines of Spinoza with those of Leibnitz). *Placidæ Vindicæ Modestæ Disquisitionis*, *Ibid.* EOD. *Bescheidene aufpührliche Entdeckung der Falschen und Schädlichen Philosophie*, *Halle*, 1724, 4to. *Nova Anatome seu Idea Analytica Systematis Metaphysici Wolfiani*, *Francof. et Lips.* 1726, 4to.

A Complete Collection of the Works published during the Controversy between Wolf and Lange has been printed (in Germ.) at Marburg, 1737, 8vo.

<sup>r</sup> Objections to the Rational Thoughts of M. WOLF on God, etc. part I, *Halle*, 1723, 8vo., part II, 1724. Wolf replied by his *Sure Method* in answer to False and Calumnious Imputations, 1723 (Germ.)

<sup>s</sup> † Objections to the Rational Thoughts of WOLF on the Faculties of the Human Intellect, etc., *Giessen*, 1731, 8vo.

*Darjes* (the same). Most of the controversies affected less the general theory of Wolf and Leibnitz than particular doctrines, for instance, the *Monadologia*; the *Pre-established Harmony*; *Free-will* and *Determinism*. Some fine observations relative to *Method* were occasionally elicited.

357. *Andreas Rüdiger*<sup>†</sup> distinguished himself as an Eclectic of an original character, of great acuteness and learning; detected many imperfections inherent in the system of philosophy then prevalent, and endeavoured to reform it. He repeatedly changed, however, his own views; nor was his mind sufficiently profound to enable him to arrive at a well-founded system. He rendered considerable service to *Dialectics* (though he erred in confounding the province of *Logic* with that of *Metaphysics*), and particularly in his elucidation of the doctrine and theory of *Probability*, which in a great measure had been neglected. His thoughts on the two methods of *sensible* and *intellectual* demonstration (*Mathematical* and *Metaphysical*), contain some valuable hints, and the germs of a clear distinction between *Mathematics* and *moral philosophy*. He made *sensation* and *reality* the ultimate foundation of philosophical truth. He maintained the spirituality of the soul, yet supposed it to possess extension, like all other created essences. *Elasticity* he held to be the characteristic property of *Body*. He attacked *Wolf* on the subject of *Pre-established Harmony*, asserting that it was incompatible with the free-agency of man. As a teacher he had considerable influence<sup>u</sup>. *Jean*

<sup>†</sup> Born at Rochlitz, 1673: was the pupil of *Thomasius* (§ 352); and died at Leipzig, 1731.

RUDIGERI *Disp. de eo, quod omnes Idæ Oriantur a Sensione*, Lips. 1704. *De Sensu Veri et Falsi libri IV*, Hal. 1709, 8vo. second edition; Lips. 1722, 4to. *Philosophia Synthetica*, Hal. 1707; second edition, with this title: *Institutiones Eruditionis*, 1711, 8vo.; third edition, corrected, 1717. *Physica Divina, Recta Via, eademque media inter Superstitionem et Atheismum*, etc. *Francof. ad M.* 1716, 4to. *Philosophia Pragmatica*, Lips. 1723, 8vo. † *Opinions of Wolf respecting the Nature of the Soul, etc.*, with the *Objections of Rüdiger*, 1727, 8vo.

*Pierre de Crousas* (§ 343) instituted a most complete examination of the system of Wolf<sup>x</sup>. He was an Eclectic, as was *J. F. Buddeus*<sup>y</sup> (§ 352), *J. G. Walch*<sup>z</sup>, *S. C. Hollmann*<sup>a</sup>, with several other learned men of that day. His works contain a rich fund of excellent remarks and judicious opinions.

358. *Chr. Aug. Crusius* by his acuteness as a reasoner has deserved the first place among the opponents of Wolf. He was born at Leune near Merseburg, in 1712, and having studied under Rüdiger, became professor of theology and philosophy at Leipsic; where he died in 1775. The disinclination for Wolf's system, which he

had imbibed from his preceptor, was confirmed by a sincere attachment to revealed religion, and by his practical temper. He endeavoured to discover a system in unison with Reason and Revelation, which might correct the errors of Wolf's theory, especially objecting to the abuse of the principle of "a Sufficient Reason." His mind, however, was not sufficiently profound nor liberal, nor his observation of the human mind sufficiently comprehensive to enable him to detect and expose the leading errors of the Dogmatism of his day. Consequently he was unable to effect any real reformation, though his views were, in many respects, more correct than those of his contemporaries. He became the author of an ingenious, well-digested, consistent, and harmonious system; but frequently lost himself in capricious hypotheses, and mystical conceptions<sup>2</sup>. According to him, *Philosophy is the sum of rational truths, of which the objects are durable in their nature*. It is distinguished from Mathematics by its Object and Method. It comprehends Logic, Metaphysics, and Practical philosophy (*Disciplinarphilosophie*). Instead of the principle of Contrariety or Contradiction, which Wolf had adopted as the foundation of his system, he lays down that of *Conceivability* (*Gedenkbarkeit*) which comprehends, as he asserts, the principles of Inseparability, and Incompatibility; and assigns as the proximate reason of the certainty of human knowledge, the impulse of which we are conscious, and (as it were) a sort of *internal constraint* to accept certain things as truths: referring to the Divine

Veracity as the ultimate foundation of all ascertained Truth.

In Logic he sets out with psychological observations; attributing to the soul a plurality of faculties. In metaphysics he limits and restricts the 'Sufficient Cause' of his adversaries, by distinguishing between the Essential Cause and the Causal (*Existential—und Causalursache*); and by assuming as the principle of Free-agency that of Original Activity: which theory implied that of Indifferentism. He examined with accuracy the idea of Existence, and maintained that Space and Time were Abstracts of Existence; which compelled him to consider them as attributes of God and elementary essences. He rejected the customary proofs of a Divinity, derived from the idea of a Perfect Being, because it was confounding, as he asserted, real with ideal existence: and also that deduced from the contingent objects of the material world: and, instead, attempted to draw one from the Contingency of Substances. He attributed to the Deity a supreme free-agency, infinite and unrestricted: acknowledged Him to be the sole Creator and Governor of the world: asserted His will to be the only law of reasonable beings: and His glory the final cause of the creation. He was led by these views to reject the Optimism of Leibnitz. Another Eclectic, very popular in his day, *Joach. J. Darjes*<sup>a</sup>, resembled Crusius in many of his opinions. In Practical philosophy he more approximated Wolf.

359. In *Morals*<sup>b</sup>, Crusius drew his conclusions not

<sup>b</sup> CRUSIUS, *Anweisung vernünftig zu leben*, darinnen nach Erklärung des menschl. Willens die Natürl. Pflichten und die Allgem. Klugheitslehren im

from the conceptions of the intellect, but the suggestions of the will and conscience. He derived the idea of duty from moral necessity or *obligation*: He asserted the free-agency of the human mind (which he contemplated principally in a negative point of view, i. e. as uninfluenced by physical or material laws), and developed the formal conditions of our free-will actions, and the motives of them. The principle of a moral law led him to that of a moral Governor and Legislator, and consequently to the hypothesis which ascribes all moral obligations and laws to the Divine Authority, deducing, as the Schoolmen had done, the principles of Morals from the Will of God. *That what is consistent with the nature of the Divine perfections, and accords with the designs of God, is good; and becomes obligatory on all rational beings.* God demands of His rational creation, in the first place that they should be good: and also wills their happiness, as a consequence of virtue.

This system contains many excellent and true remarks, and some well-founded though incomplete distinctions between Necessity and Duty, or Obligation—Happiness and Virtue; but founded as it is upon an external principle of obligation, and without a determinate notion of virtue, is far from the perfection necessary to the ends of science.

#### DISSEMINATION OF THE PHILOSOPHICAL SYSTEM OF WOLF AND HIS ADHERENTS.

360. In spite of all his opponents and persecutions (especially in the first quarter of the eighteenth century), Wolf had many followers, and became the founder of a School which was long the prevailing one, (especially during the second quarter of the eighteenth century), and possessed great influence through the talents of those who espoused it. The Leibnitzo-Wolfian theory was at first defended, enlarged, and applied, in a form decidedly

*richtigen Zusammenhange vorgetragen werden, Leipz. 1744, 3. Aufl. 1767, 8vo.*

Scholastic: subsequently, a greater degree of good taste and a more liberal style was adopted by its adherents, after the manner of the French and English writers <sup>c</sup>.

The most celebrated disciples of Wolf were: *G. Bern. Bilfinger*, or more properly *Büllfinger* <sup>d</sup>; *L. Ph. Thummig* <sup>e</sup>; and among the Theologians, the provost *J. G. Reinbeck* <sup>f</sup>; *I. Gottl. Canz* <sup>g</sup>; *J. P. Reusch* <sup>h</sup>; and *G. H. Riebov* or *Ribbov* <sup>i</sup>. To these must be added the

at a system of *Æsthetics*, (or the principles of Taste). He described philosophy as the science of properties, which can be known by other means than that of faith. *G. Fr. Meier*<sup>u</sup>, a disciple of the former, commented on the treatises of his master, and enlarged on certain questions.

361. Gradually, (about the middle of the eighteenth century), this school lost much of its credit, and the peculiar and pedantic formalities of the Wolfians were turned into ridicule<sup>x</sup>. Metaphysics too, sank in the public esteem; and the minds of men became directed more to the variety and multiplicity of objects to which a principle may be applied, and less to the investigation of a simple principle itself:—to the acquisition of fresh knowledge rather than to the consolidation of that already acquired. The Empiricism of Locke daily gained ground, and in consequence of this and of the prevailing spirit of the age, and a renewed taste for the *history* of philosophy, a species of Eclecticism began to prevail, more

adapted to pursuits of elegance and popular utility, than to the abstract research of remote principles.

### I. *Scepticism of Hume.*

362. The spirit of Experimentalism continued to retain its predominant influence in England. *David Hartley*<sup>1</sup>, the physician, whose religious and moral character bore a considerable resemblance to that of Bonnet (§ 365), pursued the inquiries of Locke relative to the soul, on principles exclusively materialist. The Association of ideas he made the foundation of all intellectual energy; and derived it from certain vibrations of the nerves. He allowed to man only a subordinate degree of free-will, asserting that the Deity is the original cause of all the operations of Nature, and that mankind are nothing more than His instruments, employed with reference to the final end of the Universe. The morality or immorality of actions is determined by their tendency to produce happiness or misery. Presently a much more acute genius pursued the path marked out by Locke, till he arrived at a more complete and decided Scepticism. The idealism of Berkeley (§ 340), which had never been popular, instead of checking, as its author had hoped, the spirit of Scepticism, contributed to encourage it. This was what *David Hume* did not fail to remark. He was born at Edinburgh in 1711, and early forsook the study of law for that of history and philosophy, to which he devoted the remainder of his life<sup>2</sup>. Taking the experi-

mental principles of Locke as the foundation of his system, he deduced from them many acute but specious conclusions respecting the nature and condition of man, as a reasonable agent. He was led on by arguments, the fallacy of which is lost in their ingenuity, to the inference that there is no such thing as ascertained *objective* truth: that our views are limited to the phenomena of Consciousness,—the impressions we are conscious of, and the *subjective* relations of the latter. The investigations of Hume were recommended not only by a great appearance of logical argumentation, but by an elegance, and propriety of diction, and by all those graces of style which he possessed in so eminent a degree; and which made his scepticism more dangerous than it deserved to be. Our perceptions, according to Hume, are to be divided into impressions or sensations and ideas: the last are copies of the former, and differ from them only inasmuch as they are less forcible and vivid. All the objects which reason can contemplate are either relations of ideas (for instance, the elements of Mathematics), or facts and matters of experience. Our conviction of the reality of any fact is founded on Sensation, Reflection, and an estimate of the relations of cause and effect. Our acquaintance with the laws of Causality does not come to us by any *à priori* principles, but simply by experience. We expect from similar causes similar consequences; and the principle of this anticipation

*Essays on Suicide and the Immortality of the Soul*, *Lond.* 1789, 8vo.

is to be sought in the *habitude* of the connection of certain phenomena, and in the Association of our ideas. There exists therefore no certain knowledge independent of Experience; nor any Metaphysical science, properly so called. After all, Experience does not possess any such demonstrative evidence as do the Mathematics; but is based upon a certain instinct, which may prove deceptive. We find that instinct contradicts the conclusions of philosophy with respect to the ideas of Space, Time, and Causality; and consequently we are compelled to doubt the evidence of Experience in these particulars: unless we give the preference to Natural Instinct over philosophical Scepticism. Geometry and Arithmetic are objects of abstract Science: Criticism (in matters of Taste) and Morality are objects of Sensation, and in no respect *form part of the province of the understanding*. In *morals*, Hume asserted that merit consists in the utility or agreeableness (*utile et dulce*) of man's character and qualities, as relating to himself or to others: he allowed that the understanding had considerable weight in the formation of a moral judgment, but denied that it was sufficient of itself to pronounce a sentence of moral approbation or disapprobation. Consequently he was led to make the Moral Sense, which he identified with Taste, the *primum mobile* of moral action. This Sense consists in a sentiment of human happiness and misery. His theory was calculated to support that of an original Moral Sense.

As for the question whether Self-love or Benevolence preponderate in the human mind, he leaves it unanswered.

The Scepticism of Hume was originally directed against the conclusions only of Speculative philosophy, but in fact would destroy the foundations of all real knowledge. He directed, however, his objections principally against the existence of the Deity, His providence; against the reality of Miracles, and the Immortality of the Soul: asserting that all these doctrines were unsupported by sufficient evidence.

His life and character were estimable. He died, August 25th, 1776, with perfect serenity and even gaiety.

### OPPONENTS OF HUME, AND OTHER PHILOSOPHERS OF THE ENGLISH AND SCOTTISH SCHOOLS.

363. The Scepticism of Hume acquired of course the greatest notoriety, attacking as it did the foundations of religious as well as moral truth. Many antagonists of his doctrines undertook to refute them, but, instead of striking at the root of his Sceptical objections, and demonstrating their fallacy, they contented themselves with appealing to *Common Sense*, which was just what Hume desired. Among his opponents we must reckon in the first place three Scotchmen; *Thomas Reid*<sup>a</sup>, a sincere inquirer after Truth, who maintained the existence of certain principles of knowledge, independent of experience, and treated moral philosophy as the Science of the human mind, allowing it, however, no other foundation than that of Common Sense, or a species of Intellectual Instinct.

The eloquent *James Beattie*<sup>b</sup>, espoused the same cause with greater ardour, but with less of a philosophical spirit, and laboured to vindicate the truths attacked by the Sceptics; admitting the principle of a Moral Sense. He was the author also of some elegant treatises on *Æsthetics*.

<sup>a</sup> Born 1704; became a professor at Glasgow; and died 1796.

I, *Edinb.* 1790; tom. II, 1793.

Lastly, *James Oswald* (flourished about 1769), a Scotch Ecclesiastic, exalted the principle of Common Sense<sup>c</sup> into the supreme canon of all truth, and the ultimate rule in all inquiries.

These authors have demonstrated the mischievousness of speculation when it would reduce all our convictions to demonstration: but have not avoided a contrary fault, that of making the intellectual principle inert and passive.

364. The celebrated physician, *Joseph Priestley*<sup>d</sup>, criticised at the same time both Hume and his antagonists. He may be said to have been more successful with the latter, whose *instinctive principles* he justly styled *qualitates occultæ*. In opposition to Hume he alleged a proof of the existence of the Divinity, which was untenable<sup>e</sup>. He was a rank Determinist, and consistently with his principles, controverted, as Hartley had done, the doctrine of free-agency, and endeavoured to establish a system of materialism like that advocated by his predecessor<sup>f</sup>. Next came *Edward Search* (his real name was

*Abraham Tucker*<sup>s</sup>), who, in questions of Morals, referred every thing to personal expediency. On the other hand, *Richard Price*<sup>h</sup>, in opposition to the Experimentalists, who would derive all our ideas from Sensation, maintained that the understanding is essentially distinct from the sensual system, and the source of phenomena not to be confounded with those which originate in the senses. He investigated with acuteness and ability many important questions relative to Morals, and controverted the doctrine of a Moral Sense, as irreconcilable with the unalterable character of moral ideas, which, as well as those of Substance and Cause, he maintained to be eternal and original principles of the intellect itself, independent of the Divine Will. He has admirably illustrated the differences existing between Morality and Sensation—Virtue and Happiness; at the same time that he points out the intimate connection existing between the two last<sup>i</sup>. On the other hand the theory of a moral sense found a defender in *Henry Home*<sup>k</sup>, distinguished for his Critical works; and in *Adam Ferguson*<sup>l</sup>, who

made virtue consist in the progressive development of the powers of the Soul in its advance towards intellectual perfection. *Adam Smith*<sup>m</sup>, a friend of Hume's, and principally celebrated for his work on the *Wealth of Nations*, the text-book of Political Science, maintained that Morality can only consist in actions which are of a sort to merit universal approbation; and consequently made *Sympathy* the principle of Morality. By means of this faculty we put ourselves in the situation of the agent whose conduct we are considering, and then pass a sentence, uninfluenced by personal considerations, on the *propriety* or *impropriety* of his conduct. From such judgments, repeatedly formed, are deduced, according to Smith, general rules for our own conduct. The sum of his morality is this: "So act that other men may *sympathise* with you."

*Thomas Payne*<sup>n</sup>, one of the founders of the independence of the United States, astonished even the English by the furious democracy of his ravings.

In connection with the metaphysical labours of the British writers, we ought to mention essays on the principles of Taste by *Alison*, *Gerard*, and *Burke*; as well as their speculations on Language, and the History of Mankind.

365. Philosophical research in England constantly pursued the path of experiment, sometimes with acute and profound, at other times with narrow and superficial views; religion being throughout the principal object to which its inquiries were directed. The same tendency prevailed in France also, modified however by the character of the French nation, as well as by the influence still possessed by the clergy. The metaphysics of Descartes and Malebranche had fallen into oblivion; Gassendi and Newton having taken their place; though a still more numerous party devoted themselves to the principles of Locke. Montesquieu<sup>o</sup>, who investigated the Laws of Nations with the genius of a true philosopher, and the mathematician and naturalist *P. L. Moreau de Maupertuis*<sup>p</sup>, pursued the experimental method without calling in question the truth of Revealed Religion. The influence of the philosopher of Ferney was more extensive and pernicious (see the following §). *Ch. Batteux*<sup>q</sup>, may be considered the first Frenchman who proposed a theory of the fine arts. *Etienne Bonnot de Condillac*<sup>r</sup>, laboured to bring to perfection the system of Experimentalism, and to trace all the operations of the mind of Man, since the Fall, to Sensation, by means of the prin-

ciple of the transformation and modification of its phenomena. The cultivation of Language he asserted to be the medium of improvement to Science ; and maintained that Language had its origin in the involuntary cries by which we express pleasure and pain. He affected to analyse all knowledge according to the mathematical method, and laboured to reduce each particular science to its most simple expression, or in other words, to an identical proposition. It may be remarked that he confounds in his theory the principles of Experimental and Speculative philosophy, and approximates the Atomical Theory of Gassendi, by enumerating among original facts that of the existence of bodies ; (see the Theory of Gassendi, § 314). *Charles Bonnet*\* also rendered considerable service to psychology. He was an admirable observer of Nature, with a mind habitually religious. *He* also derived all our ideas from sensation, by means of certain fibres and their vibrations ; distinguishing the mind from the body, but allowing it to possess nothing of its own but a twofold capacity of Sensation and Impulsion. He denied the doctrine of innate ideas ; deduced all the phenomena of the understanding from sensation, and was consequently led to maintain that the Soul can effect nothing but through the agency of the body ; which is the source of all the modifications of which the other is susceptible. In this manner he approached Materialism, and admitted the existence of an affinity between the reason of men and of other animals. Other writers followed up the consequences deducible from the Empirical System with greater consistency and

cipally to the influence of the French Encyclopedists the popularity which was enjoyed by a species of philosophy<sup>2</sup> which consisted in unfounded speculations (on the principles of Materialism) on all abstruse subjects, together with arguments from analogy pushed to an extravagant length. To this must be added, the affectation of making science of every kind popular and accessible to all; and the habit of ridiculing as pedantic all serious and profound philosophical inquiries.

366. The men who at this period were dignified in France with the title of philosophers, professed to remove the fetters in which freedom of thought was confined; but influenced by narrow and frivolous views, disseminated none but worthless doctrines which had the tendency to confound rational man with brute Nature, or on the other hand to deify the material world: pronouncing the belief in a God to be superfluous or problematical, and rejecting all *positive* or revealed religion as a device of priestcraft. The universal corruption of the aristocracy, and the puerility of a ceremonial form of worship, procured for such opinions a ready acceptance. With views like these the Encyclopedists prosecuted with zeal their

pernicious plan; particularly *Diderot*<sup>a</sup>, and *D'Alembert*<sup>b</sup>; aided by the popularity of Helvetius and Voltaire<sup>c</sup>. Others (like *Rousseau*), whose views were not altogether so objectionable, did more harm than good by a mass of declamations, well-meant in certain respects, but pernicious in their effects. In *practical* philosophy, the opinion daily gained ground that the little Morality they chose to require, ought to be founded on experimental observation of the nature of Mind. From Self-love they deduced a system of Self-expediency, at variance with the essential characteristics of morality. In this manner Helvetius attempted to deduce all meritorious actions from interested motives, and allowed them to be meritorious only as far as they contributed to the well-being of some particular society of men<sup>d</sup>. Others inconsistently attempted to ally the maxims of a better system of

morality to exclusive Self-love : for instance *Mably*<sup>a</sup>, and *Rousseau*, who had the talent to declaim about virtues which he did not practise<sup>f</sup>; and who, with *Robinet*<sup>g</sup>, admitted the existence of a moral sense. The daring and short-sighted speculations of *Rousseau* respecting Nature, Education, and Polity, are sufficiently known, as well as the pernicious results to which they conducted. To this second description of French moralists Diderot also belongs<sup>h</sup>.

It may be remarked that after the publication of Montesquieu's splendid work on Law, a great degree of attention was excited in France by the subject of Legislation; which was treated by their writers with unrivalled temerity and extravagance. Abundance of theories on this subject, as well as on the Laws of Government and Nations, appeared, professing to discuss those points with a view to the Principles of Philosophy<sup>i</sup>.

368. It contributed to the impression which the works of Hume at first excited in Germany, that men had become in a manner weary of long and profound investigations of which they had seen so many unsuccessful instances; and had tacitly adopted the conviction that Truth is not to be attained by any single system, but, like a ray of light, is refracted and dispersed through many. In the place therefore of laborious research succeeded a species of Eclecticism<sup>n</sup> which contented itself with adopting whatever had an appearance of probability to recommend it, more especially if it seemed likely to prove of popular utility. *J. G. Sulzer*<sup>o</sup>, a clear-sighted and talented inquirer, who united powers of observation to those of speculation, hesitated between the views of Wolf's school and those of the British metaphysicians, and in his investigation respecting the fine arts, which have done him honour, made it his object to discover a *moral* principle to account for their influence. He directed the attention of his countrymen to the speculations of Hume. Hitherto Eclecticism had proved a species of rampart against the overwhelming influence of particular systems; but at the epoch of which we are speaking it was nothing but a consequence of the doubt and uncertainty which embarrassed the minds of men. Empiricism had overpowered and stifled metaphysical inquiry, aided by the influence of French manners and

literature, which found a powerful patron in Frederic the Great<sup>p</sup>. Such a state of things gave birth to the system of *J. B. Basedow*<sup>q</sup>; who nevertheless endeavoured to combine solidity of argument with popular utility; and proposed felicity, the sentiment of approbation, and analogy, as principles of Truth; at the same time that he admitted in certain cases the obligation of belief, as a species of probable knowledge, superior to the testimony of the senses. Then came the system of the Jewish philosopher *Moses Mendelssohn*<sup>r</sup>, who endeavoured to unite elegance to perspicuity in his speculations on the principles of Taste and Psychology. Next, the Naturalism of *G. S. Steinbart*<sup>s</sup>, and the Essays of *J. A. Eberhard*<sup>t</sup>;

a dexterous inquirer, who had the merit of making an able attempt to revive the principles of Leibnitz, and distinguished himself in the *application* of philosophy. —*E. Platner*<sup>a</sup> also inclined to the ideas of Leibnitz, but with a more sceptical turn of mind and greater acuteness; and added some valuable essays on Anthropology and Physiology. The tendency to a system of mere Eudæmonism which had been remarked in Wolf's theory, betrayed itself in the modified form it assumed under the hands of Platner: according to whom happiness or well-being, is the end of all existence, and *good* is that which conduces to the happiness of individuals, and of all; Virtue being free-will directed towards the attainment of what is truly good.

*Christian Garve*<sup>x</sup> made morality consist in the fulfilment of those laws which are obligatory on mankind at large, in all their various relations: such are the several principles of Virtue—Propriety—Benevolence—and Order. The Revision of Philosophy, by *Chph. Meiners*<sup>y</sup>, belongs

Great Britain, a species of empirical Psychology had acquired astonishing credit and influence. *Tetens*, (mentioned in preceding section), particularly distinguished himself, by prosecuting the inquiries of Locke respecting the origin of knowledge, with great acuteness, and without any taint of materialism. He illustrated the operations of the faculties of the understanding; made it his object to substantiate the proofs of an *objective* Truth, and to refute the scepticism of Hume; and thus eventually fell into the same path which was pursued by Kant. He attracted, however, little attention in his day. We may here place the anthropological researches of *C. F. Irwing*<sup>d</sup>, *J. H. Campe*<sup>e</sup>, *Dietr. Tiedemann*<sup>f</sup>, *Platner*, *Garve* (see preceding section), *C. Ph. Moritz*<sup>g</sup>, *J. J. Engel*<sup>h</sup>, *Fr. Joach. Eschenburg*<sup>i</sup>, of the able critic *J. G. E. and the theologian *J. G. Von Herder*<sup>1</sup>, a man of comprehensive mind, besides many other writers on Criticism and the Fine Arts, some of whom followed the principles promulgated in Great Britain (by Hutcheson, Gerard, Hume, Home, and Burke, etc.); while others adopted the French theories, (particularly that of Batteux, see § 365); and others again attempted paths of their own. The influence of Moral Philosophy became more perceptible; not only as affecting the sciences immediately connected with it, such as the Mathematics, Physics, Natural History, and Medicine; but as operating on certain subordinate branches of science up to that time neglected; such as *Education* (treated after Rousseau by *Basedow*, *Campe*, *Reswitz*); *the theory of Language* (by *Herder* after *Harris*<sup>m</sup> and *Monboddo*); and *The History of Mankind* (zealously investigated by *Meiners*, *Isaac Iselin*<sup>n</sup>, and *Herder*. The last attacked the jejune system of pretended discovery prevalent in his time, seconded by his ingenious contemporary *J. G. Hamann*<sup>o</sup>, as well as by *Jacobi* (of whom presently), and by *Matthias Claudius* (the messenger of Wandsbeck). Among these *C. Th. Ant. Maria Von Dalberg* also deserves a place<sup>p</sup>.

<sup>1</sup> Born at Morungen, 1744; died at Weimar, 1803.

The author of various works on Phil. Hist. and the Fine Arts, particularly: *Ideen zur Philos. der Gesch. der Menschheit*; *Preisschrift über den Ursprung der Sprache seit, 1772—89*. *Adrastea*; *Kalligone*; *Terpsichore*, etc.

<sup>m</sup> Born at Salisbury, 1709; died, 1750.

<sup>n</sup> Born at Bâle, 1728; died, 1782.

*Versuch über die Gesch. der Menschheit*, 1764, 8vo.

<sup>o</sup> Born at Königsberg; died at Münster, 1788.

HAMANN'S *Schriften* herausg. von FR. ROTH, 1—8 B., *Berl.* 1821, 8vo. (reviewed by HEGEL in the *Jahrbücher der wiss. Kritik*, 1829). For his correspondence with JACOBI see the works of the latter. See also the *Sibylline Leaves of the Magician of the North*, published by D. FR. CRAMER, *Leipz.* 1819, 8vo.

<sup>p</sup> Elector, Arch-Chancellor, and then Grand-Duke of Franckfort, and subsequently Archbishop of Ratisbon: born, 1744; died, 1817.

*Betrachtungen über das Universum*, *Erf.* 1776, VII Aufl. 1821. *Vom Verhältniss zwischen Moral und Staatskunst*, *Erf.* 1786, 4to. *Gedanken von*

*Retrospective.*

370. A review of the progress of philosophy during the period we have been considering will convince us that it had gained more in the apparent extent than the real value of its dominion. It is true that the different branches of philosophical science had acquired a rich mine of fresh materials, and a new study, that of the theory of Taste, had been laid open: the *application* of Philosophy to particular subjects, (for instance those of education and the political sciences), had been enlarged, and the influence of Moral Philosophy had come to be recognised throughout the whole circle of human knowledge. On the other hand, little progress had been made in the improvement of a philosophical *Method*. The questions respecting the true character of Philosophy, its Form, and its End, were scarcely stirred at all: the conflicting opinions with regard to the origin of knowledge had not been reconciled; and notwithstanding the recourse which had been had to the different methods of Observation, Reflection, and Demonstration, the principles of their application had scarcely been discussed. Everywhere prevailed Incertitude, Doubt, and Dissension, respecting the most important questions; with a barren and superficial Dogmatism. The combatants on every side had laid aside their arms rather from indifference and disgust for intellectual speculation, than because any one predominant and satisfactory solution of the points at issue had established peace. The philosophical sciences stood in need of more accurate limitations and more completely scientific forms, in consequence of the want of *Principles*; which the reformation Psychology had pretended to effect was inadequate to supply<sup>1</sup>.

der Bestimmung des moral. Werths, *Erf.* 1787, 4to. Grundsätze der Æsthetik *ebend.* 1791, 4to. Vom Bewusstseyn als allgem. Grunde der Weltweisheit *ebend.* 1793, 8vo. u. a.

<sup>1</sup> Revision der Philosophie (by MEINERS). See above § 368, note.

371. In Practical philosophy also might be observed a conflict between the opposite tendencies of Empiricism and Rationalism; in which the former had obviously obtained the advantage. The claims of the Intellect had not indeed been altogether rejected, but had seldom been fairly and freely discussed; the Understanding being perpetually confounded with *Reflection*, and treated as the handmaid of sensation; and not as an independent power and energy. Some inquirers (e. g. Geulinx and Rich. Price) had detected the two grand defects of most systems of Morality then received: 1st. That they either set out with self-love as their principle, or terminated in it as their end; producing nothing but a series of maxims more or less subservient to the mere attainment of Happiness by the exercise of Prudence. 2ndly, That they did not recognise the Intellect as the first legislating principle of free-agency.

No lasting reform was however brought about by these observations.

The Ethics of the day, accordingly, amounted to little more than a selection of what appeared to be the best results, on an Eclectic plan, and with views altogether *subjective* and personal; consisting in deductions from the principles of Self-love and Sympathy. Free-will—the first requisite of a sound system of Ethics—occasioned considerable perplexities to the supporters of such theories; since either they contemplated a free-will purely psychological, or laboured to solve the problem on metaphysical grounds, and thereby inclined to Determinism: or maintained a blind and unprincipled free-agency, against which theoretical reason revolted. In proportion as the disputants became more and more sensible of the difficulties belonging to this question, they were tempted to desert the prosecution of such inquiries altogether, and to adopt in their stead the easier task of rendering Philosophy *popular* and—*superficial*.

372. A reformation in Philosophy had now become necessary. It was effected by a philosopher of the first order, who had qualified himself to correct the principal defects of the former systems by a long and ardent, but secret study of all the branches of the subject. His appearance at that time was the more opportune, because already several men of talent (*Lessing, Winkelmann, Hamann, Herder, Göthe*, and others) had excited by their various compositions a great degree of intellectual activity, and created a capacity for the reception of new

ideas on Science and the Arts. *Emmanuel Kant* was born at Königsberg, the 22nd of April, 1724; became a professor in the same city, and died February 12th, 1804. He may be styled a second Socrates, having created a new philosophy, which, by investigating the origin and the limits of human knowledge<sup>a</sup>, revived the spirit of research, extended it, taught it its present position, and directed it to the true path of Science, through the cultivation of Self-knowledge. For the accomplishment of this task he was qualified by uncommon talents, studiously cultivated, and enriched by extensive reading. His piety and virtue set bounds to an exclusive spirit of speculation, and imparted to his works the character of their author. A profound love of truth and a pure moral sentiment became the principles of his philosophy, to which he added the qualities of originality, solidity, and sagacity, in an eminent degree. The revolution which he was thus enabled to effect was astonishing. It is true that it was not brought about without many impediments, but its consequences have been immense, and the whole course of philosophy has been modified by its influence.

For the works of Kant see below, § 377.

373. His attention being awakened by the Scepticism of Hume (§ 362), he was led to remark the very different degree of certainty belonging to the deductions of Moral Philosophy and the conclusions of Mathematics; and to speculate upon the causes of this difference. Metaphysics of course claimed his regard; but he was led to believe, that as yet the very threshold of the science had not been passed. An examination of the different philosophical systems, and particularly of the jejune Dogmatism of Wolf, led him to question whether, antecedently to any attempt at Dogmatic philosophy, it might not be necessary to investigate the *possibility* of philo-

<sup>a</sup> Hence called the Critical method, or that of investigation and examination.

sophical knowledge, and he concluded that to this end an inquiry into the different sources of information and a critical examination of their origin and employment were necessary: in which respect he proposed to complete the task undertaken by Locke. He laid down in the first place that Moral Philosophy and Mathematics are, in their origin, *intellectual* sciences. Intellectual knowledge is distinguished from experimental by its qualities of *necessity* and *universality*. On the possibility of intellectual knowledge depends that of the philosophical sciences. These are either synthetic or analytic: the latter of which methods is dependent on the first. What then is the principle of synthetical *à priori* knowledge in contradistinction to experimental; which is founded on observation? The existence of *à priori* knowledge is deducible from the mathematics, as well as from the testimony of common sense; and it is with such knowledge that metaphysics are chiefly conversant. A science, therefore, which may investigate with strictness the possibility of such knowledge, and the principles of its employment and application, is necessary for the direction of the human mind, and of the highest practical utility. Kant pursued this course of inquiry, tracing a broad line of distinction between the provinces of Moral Philosophy and the Mathematics, and investigating more completely than had yet been done the faculty of knowledge. He remarked that synthetical *à priori* knowledge imparts a *formal* character to knowledge in general, and can only be grounded in laws affecting the Individual, and in the consciousness which he has of the harmony and unison of his faculties. He then proceeds to analyse the particulars of our knowledge, and discriminates between its elementary parts so often confounded in practice, with a view to ascertain the true nature of each species: the characteristics of necessity and universality which belong to *à priori* knowledge, being his leading principles.

374. The faculty of theoretical or speculative knowledge is composed of Sensibility and Understanding,—

Apprehensiveness and Spontaneousness. The *material* part of sensibility consists in the sensations which belong to it; the *formal* conditions are space and time. Space and Time have no reality except in our conception of them, but may be said to exist *à priori*, as *conditions* of our perceptions. The understanding combines, in the form of ideas and judgments, the materials supplied by the sensitive faculties. The laws according to which the understanding acts, independently of experience (or rather regulating experience), are the (four) categories. These, with the conditions of sensitive perception (*viz.* Space and Time), make up the *forms* and *elements* of pure Intellect. The forms of sensibility and intellect determine and define knowledge: they adapt themselves to the materials supplied by sensible experiment, and are independent in their own nature of the phenomena to which they are applicable. The grand conclusion of the Critical system of Kant is this, that no object can be known to us except in proportion as it is apprehended by our perceptions, and definable by our faculties for knowledge; consequently, we know nothing *per se*, but only by means of its phenomena. In this consists his Critical Idealism, (being founded on a critical examination of the faculties of knowledge), or, as it is otherwise termed, his *transcendental* Idealism. In consequence of these distinctions, it follows that our knowledge of real objects must be acquired by experience; and that *à priori* knowledge contemplates only their *formal* conditions, or their *possibility*. It is only under such limitations that synthetic *à priori* knowledge is possible, and within these boundaries Metaphysics must be confined. Connected with the above is the acute distinction established by him between Thought and Knowledge<sup>b</sup>, (the neglect of which has been a fertile source of error),—between the objects apprehended and our apprehensions of them; as well as the line drawn between Reason and Understanding, with reference to Logic and the Trans-

<sup>b</sup> Hence we are enabled completely to separate Logic from Metaphysics.

cidental theory. Speculative reason, considered as the art of ratiocination, labours to attain a perception of absolute unity, and to produce a connected system, by means of *Ideas*, which impart a *formal* character to the operations of the mind. Knowledge, on the other hand, is not attainable by the means of Ideas, since they have no proportionate object within the province of Experience; although Reason is perpetually labouring after a complete knowledge of God, the world, the immortality and free-agency of the soul; and although the whole artillery of Metaphysics has been constantly directed towards these points. True philosophical reason will not presume to make any *constructive* use of such Ideas, lest it should be betrayed into the labyrinth of *apparent* knowledge, and a maze of contradictions. This he proceeds to evince by a critical examination of the proofs adduced of the substantiality and immortality of the soul,—the termination and commencement of the world—(with the contrary suppositions),—the divisibility or indivisibility of substances—the necessity or contingency of causation and being, in the present world,—and the existence of God. Reason cannot *demonstrate* the existence of the objects of these ideas, which are imperceptible to the senses: nor, on the other hand, can it prove the contrary. All that is permitted to speculative reason is a *moderating* power in the employment of our ideas, for the ultimate extension of knowledge.

375. Reason, however, is not merely speculative, but also practical, having the effect of limiting our absolute Free-will by the ideas of Duty and Right. An examination of our ideas of Duty and of well-regulated Will (in which, by the common consent of mankind, consists the essence of moral worth), leads him to recognise the existence of certain *à priori* principles of a practical nature; which define not *what is*, but, *what ought to be*. Practical reason is *autonomic*—simply defining the formal character of the Will, and presupposing free-agency as a necessary condition. The Laws of Ethics are superior

to the empirical and determinable free-will which we enjoy in matters of practice, and assume an imperative character, occupying the chief place in Practical Philosophy. This categorical principle becomes an absolute law of universal obligation, giving to our conduct an ultimate end and spring of action; which is not to be considered as a passion or affection, but as a moral sense of respect for Law. Virtue, therefore, consists in obedience to the dictation of Duty, or the moral constraint imposed by the legislative power of Reason; or, in other words, in the submission of our impulses and inclinations to Reason. Morality is not Happiness, though it implies a rational title to it, and makes us worthy of being Happy. It is universal and necessary consistently with free-will. The ideas of Free-will, Immortality, and a Divinity, derive their certainty from the practical laws of Ethics. This certainty, however, is not the result of speculative science, but of a practical rational belief. By such a definition of the *Summum Bonum* and ultimate end of rational existence we are enabled to perceive with clearness the harmony which exists between the intellectual and sensual nature of man; between speculative and practical Reason.

Civil or juridical law is distinguished from moral, inasmuch as the former legislates only with respect to external actions, and provides for the freedom of all by limiting and defining that of individuals. The description of Right which results is of a Coercive character, and demands the protection of the State; which itself reposes on a contract as its foundation; being designed for the maintenance and preservation of the rights of all.

376. Speculative knowledge (founded on the idea of Nature), and Practical (founded on that of Free-agency), form two distinct hemispheres, as it were, of the same whole, and differ altogether in their principles. The faculty of *Judgment* interposes between these two powers and their objects—Nature and Free-will, (which are united by an inexplicable link in the mind of man); and specu-

lates on their mutual accordance. It does not add any thing to objective knowledge, but enables us to reflect on Nature as a Whole, by means of a peculiar principle, that of Proportionateness of the Means to the End; which is not objective but purely subjective. The Judgment therefore makes the particular subordinate to the universal; and operates partly by means of classification, partly by reflection. In the latter case, according to a principle of our nature which prompts us to employ with freedom the energies of the mind, we apply to external nature ideas derived from the understanding in the exercise of this freedom, being conscious of a species of intellectual satisfaction. In this manner we examine Nature with a view to the principles of formal Proportionateness; we discuss the principle of the pleasure derived from the Beautiful and the Sublime, and apply the same sort of *teleological*<sup>a</sup> scrutiny not only to the forms but also to the material and internal proportions of Nature. The principle by which we are guided in such observations is this: that there exists an internal proportion between the means and the end in organic nature, and although this principle does not immediately produce any direct result, it leads us to anticipate the conclusion of a final end impressed on all Nature by a Spiritual Being, imperceptible to our senses; which conjectural conviction is converted into certainty by Practical Knowledge. (*Phy-sico-Ethico-Theology*, or *Teleology*).

377. Works of Kant. His grand enterprise was his Critical examination of our faculties of knowledge, on the principles of a Transcendental Philosophy, i. e. of a theory which deduces, from an examination of the faculties of the human mind; certain established principles as the conditions of its operations; giving to all these speculations a systematic form. Of this great design Kant has completed some parts, with his characteristic originality, acuteness, and depth of thought: for instance,

<sup>a</sup> *Teleology* denotes the consideration of final causes.

the Metaphysical system of Nature, in which he has shown himself the precursor of the Dynamic Philosophy, inasmuch as he maintains that Matter fills Space in virtue of impulsive forces (those of Expansion and Attraction). To this he added his Moral Metaphysics, or Theory of Right and Virtue; as well as separate dissertations on Religious Anthropology, Education, and other important subjects, which contain many admirable and profound observations.

Kant's earlier works are :

Gedanken von der wahren Schätzung der lebendigen Kräfte, *Königsb.* 1746, 8vo. Principiorum Metaphysicor. nova dilucidatio, *ibid.* 1755, 4to. Betrachtungen über den Optimismus, *Königsb.* 1759, 4to. Monadologia Physica Spec. I, *ibid.* 1756, 4to. Versuch den Begriff der negativen Grössen in die Weltweish. einzuführen, *Königsb.* 1763, 8vo. Einzig möglicher Beweisgrund zu einer Demonstration des Daseyns Gottes, *ebend.* 1763; zuletzt 1794, 8vo. Die falsche Spitzfindigkeit der vier Syllog. Figuren, *ebend.* 1763; *Frankf. und Leipz.* 1797. Beobachtungen über das Gefühl des Schönen und Erhabenen, *Königsb.* 1764, 8vo.; *Riga*, 1771. Träume eines Geistersehers, *Riga*, 1766, 8vo.; 1769. Allgem. Naturgesch. und Theorie des Himmels, etc. IV Aufl. *Zeitz*, 1808, 8vo. De Mundi Sensibilis atque Intelligibilis Forma et Principiis, *Regiomont.* 1770, 4to.; (a work in which he gives the first hint of the plan of his great Critical undertaking). The above, with several other treatises, are collected in KANT's Kleinen Schriften, *Königsb. u. Leipz.* 1797, III Bde. 8vo. Verm. Schriften, ächte und vollst. Ausg. (herausg. von TIEFTRUNK), *Halle*, 1799—1807, IV Bde. 8vo. Sammlung einiger bisher unbekannt gebliebenen Schriften von IM. KANT (herausg. von RINK), *Königsb.* 1800, 8vo.

His principal works are :

Kritik der Reinen Vernunft, *Riga*, 1781, VI Aufl.; *Leipz.* 1818, 8vo. Kritik der Praktischen Vernunft, *Riga*, 1788; V Aufl. *Leipz.* 1818, 8vo. Kritik der Urtheilskraft, *Berl.* 1790; III Aufl. 1799, 8vo. Prolegomena zu einer jeden künftigen Metaphysik, etc., *Riga*, 1783, 8vo. Grundlegung zur Metaphysik der Sitten, *Riga*, 1785, 8vo.; IV Aufl. 1797. Metaphysische Anfangsgründe der Naturwissenschaft, *Riga*, 1786, 8vo.; III Aufl. 1800. Ueber eine Entdeckung, nach der alle neue Kritik der reinen Vernunft durch eine ältere entbehrlich gemacht werden soll, *Königsb.* 1792, 8vo. Die Religion innerhalb der Grenzen der blossen Vernunft, *Königsb.* 1793, 8vo.; II verm. Aufl. 1794. Zum ewigen Frieden, ein Philosophischer Entwurf, *Königsb.* 1795, 1796, 8vo. Metaphysische Anfangs-

gründe der Rechtslehre, *Königsb.* 1799, 8vo. II Aufl. 1803, 8vo. Metaphysische Anfangsgründe der Tugendlehre, *Königsb.* 1797, 8vo.; II Aufl. 1803. (Both are contained under the title of, *Metaphysik der Sitten.*) Anthropologie in pragmatischer Hinsicht, *Königsb.* 1798; III Aufl. 1821, 8vo. Der Streit der Facultäten, *Königsb.* 1798, 8vo.

Works of others illustrative of the above :

† The Logic of Kant, a Manual for the Academical Classes, by G. B. JÄHSCHKE, *Königsb.* 1800, 8vo. (published from the papers of the students). † Education, published by RINK, *ibid.* 1803, 8vo. † Lectures on Religious Philosophy, *Leips.* 1817, 8vo. (published from the papers of the students). † Lectures on Metaphysics, (published by the Editor of the Religious Philosophy, etc., PÖLITZ), *Erfurdt*, 1821, 8vo.

378. With regard to the general character of the Critical system of Kant, we may observe that it confined itself to a contemplation of the phenomena of Consciousness, and attempted to ascertain, by analysis, not of our ideas, but of the faculties of the soul, certain invariable and necessary principles of knowledge; proceeding to define their usage, and to form an estimate of them collectively, with reference to their *formal* character: in which investigation the distinctions and definitions of those faculties adopted by the school of Wolf, were presumed to be valid. It exalted the human mind, by making it the centre of its system; but at the same time confined and restricted it by means of the consequences deduced. It discouraged also the spirit of Dogmatical Speculation, and the ambition of demonstrating all things by means of mere intellectual ideas, making the faculties for acquiring knowledge the measure of things capable of being known, and assigning the pre-eminence to Practical Reason rather than to Speculative, in virtue of its end, viz. Wisdom; which is the highest that reason can aspire to; because to act virtuously is an universal and unlimited, but to acquire knowledge only a conditional duty. It proscribed Mysticism, and circumscribed the provinces of Science and Belief. It taught men to discriminate and appreciate the grounds, the tendency, the defects, and partial views, as well as the excellencies of other systems; at the same time that it

embodied a lively principle for awakening and strengthening the interest attaching to genuine philosophical research. It afforded to philosophy a firm and steady centre of action in the unchangeable nature of the human mind. In general, it may be observed that the theory of Kant *constructed* little; and rather tended to destroy the structures of an empty Dogmatism, and prepare, by means of self-knowledge, the way for a better state of philosophical science; seeking in Reason itself the principles on which to distinguish the several parts of philosophy.

On the other hand it has been urged against this system:

That it does not recognise the existence of Rational Ideas: because its author, without even examining into the claims of both, attributes to experience a preponderance over the opposite principle—making demonstration the sole evidence of knowledge, that it makes a distinction between speculative and practical reason, and that it dislocates, (as it were), by its subdivisions, the faculties of the human mind. To this must be added (it is objected) a certain *Formalism*, which betrays itself even in his practical system, and in consequence of which the student is led to regard things principally in a subjective point of view; that is, with a reference to the laws and forms of human action: from which to absolute Idealism is an easy step.

The following works contain criticism on Kant's theory:

D. JENISCH über den Grund und Werth der Entdeckungen des Hrn. Prof. Kant, *Berl.* 1790, 8vo. JOH. NEEB, über Kant's Verdienste um das Interesse der Philosophirenden Vernunft, II Aufl. *Frankf. a. M.* 1795, 8vo. GLO. BJ. GERLACH Philosophie, Gesetzgebung und Aesthetik in ihrem jetzigen Verhältniss zur sittlichen und ästhetischen Bildung der Deutschen, eine Prieschrift. *Posen*, 1804, 8vo. FLÜGGE's Versuch einer Historisch kritischen Darstellung des Einflusses der Kantischen Philosophie auf Religion u. Theologie. 2 Thle. *Hannov.* 1796, 1798, 8vo. TR. BEN. AGAP. 379. The first of Kant's great works produced, at its appearance, little sensation. When at last it began to attract attention, it excited a great sensation, and many questions with regard to its end and character. The very language in which it was couched, containing a set of phrases and terms entirely new, was an obstacle to its progress, and, no less than its contents, revolted the minds of most of the learned countrymen of its author. A great variety of mistakes were necessarily committed with respect to it. Some pronounced it superficial, and gave it credit for nothing more than an *appearance* of originality. Others, admitting it to be original, declared it to be dangerous and pernicious; inasmuch as it set forth a system of Idealism, which would annihilate the *objective reality* of Knowledge, destroy all rational belief in God and the immortality of the soul, and consequently was adverse to revealed religion. Several eminent men became in various ways adversaries to the new system, of whom we may particularise: *Mendelssohn*<sup>b</sup>; *Hamann*<sup>c</sup> and *Jacobi*

<sup>b</sup> M. MENDELSSOHN'S Morgenstunden. 2 Bd. *Berl.* 1785, 8vo.; (see § 368). Prüfung der Mendelssohnschen Morgenstunden, oder aller speculativen Beweise für das Daseyn Gottes, in Vorlesungen von L. H. JAKOB. Nebst einer Abhandl. von KANT, *Leipz.* 1786, 8vo.

<sup>c</sup> HAMANN: In his Letters to JACOBI—JACOBI'S Works, I u. IV B. JACOBI, über das Unternehmen des Kriticismus, die Vernunft zu Verstande zu bringen, etc., in Reinhold's Beiträgen zur leichten Uebersicht, etc., III, 1.

We may consider as unavoidable consequences of the popularity it acquired, the number of abuses to which it gave birth, such as an unmeaning use of formularies, a blind devotion to one single system, and a contempt for all experimental knowledge.

*B. Philosophical Systems subsequent to that of Kant.*

381. The triumph of Critical philosophy was of short duration. It opposed too many factions, and counteracted too many views and pretensions to obtain an easy victory. The various misapprehensions to which it gave birth raised suspicions of the correctness of the principles it contained, as well as of the propriety of the method by which they were developed. Some asserted that the theory was sufficiently refuted by Common Sense, because it amounted to nothing more than a system of mere Idealism, and destroyed the very reality of all external nature. Others went only half as far in their objections, alleging that Kant had thrust out *real existence* by one door, to let it in by another. His system was judged to be incomplete in this respect also, that by subdividing the different mental principles of Knowledge<sup>\*</sup>, it placed them side by side, as co-ordinate with one another, instead of making them subordinate to one supreme principle (§ 378). Many of its opponents objected to it that instead of weakening the cause of Scepticism it contributed to fortify it: while some of its partisans brought discredit on their cause by misapplying its formularies, or by their extravagant expectations of its success<sup>†</sup>. Besides, the views developed, particularly the distinction established between Knowledge and Science, were too new to be at

\* Such as the principles of Thought and Knowledge; a principle of Speculative Science, and a principle of Practical Reason.

cultivated his own talent for analysis, he convinced himself that he had discovered in them a principle of perpetual harmony among men of inquisitive minds, and a panacea for the evils of mortality<sup>7</sup>. His hope being disappointed by the innumerable misapprehensions which prevailed with regard to it, he laboured to discover for it some internal evidence, in corroboration of the argumentative proof it possessed already. He believed himself to have detected such a principle by the observation, that although Kant had investigated fully the faculties for acquiring knowledge, he had not examined the perceptive and imaginative faculties, which are the ultimate source of all knowledge, and necessarily modify and define it. He also complained that the Critical system was not sufficiently scientific, and, in particular, wanted a common principle influencing all its parts, and a theory founded on such a principle, which might supply the elements of Logic, Metaphysics, and the Criticism of Reason. To this end he proposed the principle of *Consciousness*. In consciousness we may distinguish between two relative terms—the Object conceived—and the Subject which conceives: by investigating the nature of mental conception and its modifications of unity and multiplicity, Reinhold endeavoured to ascertain the laws and properties of Knowledge and Consciousness, as well as the results of a critical examination of the rational faculties. This theory<sup>8</sup> had the appearance of

<sup>7</sup> See the letters of Kant mentioned § 380, note <sup>u</sup>.

<sup>8</sup> It was styled the Theory of the Faculties of mental Conception.

giving to Critical Philosophy what it wanted in unity and harmony; at the same time that it seemed to render it more intelligible by reflecting a light upon its principles as well as its consequences. It was assailed, however, at the same time by Dogmatic and Sceptical antagonists, (*Flatt, Heydenreich, Beck*, etc.<sup>a</sup>), but particularly by the author of *Ænesidemus*<sup>b</sup>. In consequence of these attacks, Reinhold himself became sceptical as to the validity of his own system, which he endeavoured to improve, partly by modifying the terms he had employed, and partly by strengthening its weak points. He ended, however, by renouncing it altogether, and adopted first the theory of *Fichte*<sup>c</sup>, and afterwards that of *Bardili*<sup>d</sup>. This genuine lover of Truth turned, in his latter days, his attention to the critical examination of Language, as the source of all the misunderstandings which have arisen in Philosophy (conducting his researches with an especial regard to

cases of Synonymy), with the hope of effecting that harmony among philosophical inquirers which was constantly his object. He endeavoured to elucidate the equivocal expressions and inconsistencies of the customary formal Logic, which he maintained to be the essential causes of the reproach so long incurred by Moral Philosophy, that it was incompetent to make good its pretensions to the character of a Science<sup>e</sup>. He endeavoured also, by a new theory of the faculties of human knowledge on scientific principles<sup>f</sup>, to bring to an end the inquiries he had started in his former attempt.

His son, *E. Reinhold* (professor of Moral Philosophy at Jena), follows the steps of his father in his inquiries respecting the relations and connection between Logic and Language<sup>g</sup>.

383. *J. Sigismund Beck* (first professor at Halle, afterwards at Rostock), an acute disciple of Kant, endeavoured to recommend the Critical System by an abridgment of it, and by making the Critical point of view the point of view also of all original mental conception: but his ideas were confused and his method bad, and he injured the cause which he sought to support, by drawing his conclusions without any previous analysis of the facul-

### *Fichte's Scientific Theory.*

For the bibliography see below, § 389.

384. The philosophical labours of *J. G. Fichte* attracted far greater attention.

He was born May 19, 1762, at Rammenau, in the Haute-Lusace, and, after having studied at the School of Pforta, and at the universities of Jena and Leipsic, passed several years in Switzerland and Prussia, and in 1793, became professor of Moral Philosophy at Jena: resigned his office in 1799, and retired to Berlin: in 1805 filled a professorial chair at Erlangen, and afterwards in the university of Berlin; where he died, 1814. Fichte made it his object to constitute the Critical philosophy a science, founded on the most exact principles<sup>b</sup>, with the hope of precluding all future errors and misapprehensions, and of annihilating Scepticism; the cause of which was defended, among others, by *Schulze* and *Sol. Mai-*

<sup>b</sup> † Idea of the Scientific Theory: Pref. p. 5. † General Principles of the Scientific Theory, p. 12.

*mon.* Encouraged by the success which his "Essay towards a Criticism of Revelation in General," obtained<sup>1</sup>, and by the example of Reinhold's theory of the perceptive faculties, he gave full scope to his original and independent genius, which, with a firmness approaching obstinacy, led him constantly to maintain and boldly to profess the conclusions to which he had once arrived. His object was to concoct a system which might illustrate by a single principle, the material and formal properties of all science; might establish the unity of plan which the Critical system had failed to maintain, and solve that most difficult of all problems regarding the connection between our conceptions and their objects. Such was the origin of his Scientific Theory<sup>2</sup>, which supposes that neither Consciousness nor the objects to which it refers,—neither the material nor formal parts of knowledge,—are to be considered as *data*; but are the results of an operation of *Ego*, and are collected by means of Reflection. Fichte does not, like Kant, begin by an analysis of our faculties for acquiring knowledge,—of practical reason and judgment; nor yet, as Reinhold had done, by assuming a primitive *fact*,—that of Consciousness; but supposes an original act of the subject (*Ego*), from which he derives the very construction of Consciousness itself.

The method he pursues is as follows. He begins by investigating the proper meaning of the term *Science*. It is a system of Knowledge based on a higher principle, which imparts a determinate value to Knowledge itself. The Theory of Science has for its object to demonstrate the possibility and validity of Science, the solidity of the principles on which it is founded, and consequently the connection and coherence of all human knowledge. Inasmuch as this Theory or Doctrine of Science is the highest of all Scientific Systems it must be dependent on a peculiar principle, not deducible from that or any other science. The Theory of Science is independent of all

<sup>1</sup> Königsb. 1792 : second edition 1793.

<sup>2</sup> *Wissenschaftslehre*.

others,—self-demonstrated, and *is because it is*. The Theory of Science implies also a System connected with it; and, contrariwise, the fact of a System implies that of a Theory, and of a first and absolute principle; the circle of argumentation being complete and inevitable. Such a Theory of Science is what we term Moral Philosophy, which has for its object the necessary laws of human action. When the energies of our minds have been determined to any particular pursuit, (such as Logic, Geometry, etc.), they become the objects of a Special Science; the determination to such particular pursuits being a contingent direction imparted to free-action, and consequently incomplete. On the other hand the Theory of Science is complete in itself, and forms a perfect whole. The objects it contemplates are, agreeably to what has been stated, the original operations of the human mind, which take place according to a certain determinate method and form. These become the objects of Consciousness by means of the faculty of Reflection, which analyses all objects, and abstracts from them whatever is not Consciousness. In this way we attain to Absolute Unity, which comprehends all Sciences and their principles; in other words, to pure *Ego*. Reflection and Abstraction are subject to certain laws of Logic, which are elementary parts of the Theory or Doctrine of Science.

385. First principle,  $A = A$ . X represents the systematic dependency of the whole. A and X being supposed to exist in *Ego* may be signified by this formulary, *Ego sum Ego*. This is the self-evident principle of Moral Philosophy and Knowledge in general; expressing the necessary form and substance of Consciousness. In virtue of this principle we form judgments; to judge being an act and operation of *Ego*. *Ego* then establishes, absolutely and independently, its own existence; being at once the agent and the result of the action: in which combination consists the essence of Consciousness. The first operation of *Ego* is that of Reflection on itself, which is occasioned by an impediment opposed to its

hitherto unrestrained energies. *Ego* places itself in the position of the subject, inasmuch as it opposes itself as subject to the obstacle contemplated. The *second* principle (involved in the former), is this—that *Ego* is not *Non-Ego*. There remains yet a *third* principle, conditional as far as relates to its form; but not as respects its value. To exemplify this, an action of *Ego* is required, which may illustrate the opposition of *Ego* and *Non-Ego* in *Ego*, without destroying *Ego*. Reality and Negation can be associated only by means of limitations. Limitation then is the third principle we were in search of. Limitation again leads us on to Divisibility. Every thing divisible is a *quantity*. Consequently in *Ego* there must exist a divisible quantity, and therefore *Ego* contains something which may be supposed to exist or not to exist without detracting from the real existence of *Ego*. Hence we arrive at the distinction of a separable and an absolute *Ego*. *Ego* implies the opposition of a divisible *Non-Ego* to the divisible *Ego*. Both of them have their existence in absolute *Ego*, being respectively determinable by a reference to that. Hence are derived the two following propositions: 1. *Ego* implies a limitation of its extent by means of *Non-Ego*, which circumscribes its absolute and otherwise unlimited influence. 2. In like manner *Ego* determines and defines *Non-Ego*. The real existence of the one circumscribes that of the other. On this point turn all the disputes between the Nominalists and Realists; and it is by a reference to this that they must be adjusted. The grand problem which speculative philosophy would endeavour to solve, is the accomplishment of such a reconciliation, and a satisfactory explanation of the connection between our conceptions and the objects to which they refer. The first of the two propositions above stated is necessary to be admitted, because without the opposition we have described there would be no such thing as Consciousness—without an *object* there could be no *subject*. *Ego* cannot be said to exist except as modified by *Non-Ego*. But *vice versâ*, without a subject there can be no object: *Ego* must also

be admitted to exist as determining *Non-Ego*: The one fact implying a passion,—the other an action of *Ego*. Our conception of external objects, as external, is an act of *Ego*, whereby it transfers to *Non-Ego* a real existence abstracted from itself. By such an operation of the mind *Non-Ego* assumes the character of something real as respects *Ego*, inasmuch as *Ego* transfers to it a portion of its own reality. Allowing that external objects impress the Thinking Subject, yet this is nothing more than the opposition of those objects as *Non-Ego* to our own *Ego* (limiting thereby the latter); the agent continuing to be the Thinking Subject and not the external Objects. From what has been stated, may be deduced: 1st. The reciprocity existing between *Ego* and *Non-Ego*. The action and passion of *Ego* are one and the same thing, as relates to *Non-Ego*. 2ndly. The operations of *Ego* tend to show that the *ideal* and *real* principles, which have been adopted to explain the connection between the mind and external objects, are identical. The explanation is to be sought in the fact that we contemplate *Ego* as active, and *Non-Ego* as passive; or *vice versâ*. By such an hypothesis the discordant claims of the Realists and Nominalists are reconciled, and the true theory of philosophical science developed.

From such principles the Transcendental theory of the faculty of mental perception infers the following conclusions. 1. Mental perception can only take place in virtue of a reciprocal action existing between *Ego* and *Non-Ego*. 2. The influence of *Ego* on *Non-Ego* is opposed to that of *Non-Ego* on *Ego*. In such cases *Ego* balances, as it were, between two contrary influences. Such hesitation is the effect of the imagination, which equally represents the passive and active operations of *Ego*; or, in other words, conveys them to the Consciousness. 3. Such a state of hesitation implies the act of contemplating, in which it is difficult to separate the contemplating Subject from the Object contemplated. It is not Reflection (the tendency of which is inwards), but activity directed towards external objects,—Production. 4. From the fa-

culty for contemplating results Contemplation, properly so called, which is the effect of the absolute spontaneousness of Reason,—i. e. of the *Understanding*. 5. Judgment, in the next place, weighs the objects presented to it by the understanding, and defines their mutual relations. 6. The contemplation of the absolute spontaneousness of *Ego* affords the apprehension of Reason, and the basis of all Science.

*Practical Application of the Scientific Theory.*

386. Two facts have been up to this point required as postulates to support the above system: the reciprocal action of *Ego* and *Non-Ego*; and the occurrence of an obstacle to *Ego*, which restricts its hitherto unlimited energies, and gives birth to *Non-Ego*. Now as the existence of *Ego* itself (involving that of *Non-Ego*) is dependent on this very circumstance, the whole system would fall for want of a foundation, if we could not deduce from *Ego* itself the principle of such an obstacle. This can be effected only by practical not by theoretical philosophy. The Scientific Theory in its practical application contemplates absolute practical *Ego*, which, by defining *Non-Ego*, becomes the principle of the obstacle alluded to, and of the limitation of the activity of *Ego*. Such an *Ego* is free, unlimited, and independent; the only true Reality; while on the other hand *Ego*, considered as Intelligence determined by *Non-Ego*, is finite and limited. In virtue of its unlimited activity *Ego* commences by circumscribing itself. This it does as a determining faculty, which implies the existence of something else determinable by it. Consequently, *Ego* possesses by implication the power of determining that which is determinable, in other words, of determining *Non-Ego*; which is *objective* activity, and the result of pure Activity. Absolute *Ego* possesses an unlimited activity, and a perpetual tendency to become the cause of something else. With such an impulse *Ego* commences an unlimited career, but

without attaining its object or becoming a Cause. In consequence of not accomplishing this end its energies are repulsed and reflected upon itself (Reflection). In virtue of its inherent activity and its inability to attain the end first proposed, *Ego* now opposes a counter-movement to its first impulse. Hence arises the obstacle alluded to, or *Non-Ego*. *Non-Ego* being once established, *Ego* assumes with reference to it the characteristics of practical, definitive, and causal. *Non-Ego* also re-acts on *Ego*, determining to a certain extent *Ego*, and opposing a counterpoise to its influence. In this manner *Non-Ego* also becomes a cause with reference to *Ego*<sup>1</sup>. It is thus we arrive at the reciprocal opposition existing between *Ego* and the external World; the former in one respect assuming the character of something connected with, and dependent on, the World, (considered as Intelligence), but in another, (as Practical), continuing free and independent of the same. In this manner, by establishing the existence of *Ego*, we establish that of the World, and by establishing the existence of the external World we establish that of *Ego*. Consequently, the World can possess reality only for an *Ego*, in an *Ego*, and by an *Ego*. The leading proposition of the theory is this: that *Ego* is absolute Activity: that all which exists out of *Ego* is produced by *Ego* by means of *position*, *opposition*, etc. *Ego* is the *subject-object*, and as such the basis of the Transcendental Idealism.

*On certain Branches of Philosophy treated by Fichte.*

387. The author of the Scientific Theory attempted to re-model on its principles some of the philosophical sciences, such as Ethics and Natural Law. His disquisitions respecting both contain many original and striking ideas by the side of an equal number of paradox-

<sup>1</sup> The perception of the limits of the activity of *Ego* is what we denominate Sensation.

ical imaginations, with an appearance of logical deduction which is fallacious and unreal, resting on no solid basis, although managed with great ability. *Ethics.* Having by his Idealism annihilated the objective reality of the sensible world, and left nothing in its place but a system of mere Images, he proceeds to establish by means of *Conscience*, a belief in the existence of a sensible world, intelligible and independent of the former; and to demonstrate the possibility of referring our actions to an attainable end. He sets out with the idea of free-will, that is, of unrestrained independent free-agency, which is the tendency of *Ego*, and on which the idea of independence is founded. Consequently, the principle of practical Morality is the necessary conviction of Intelligence, that its freedom must be defined by the notion of complete free-agency, or, in common language, that Conscience must be obeyed without limitation<sup>m</sup>. Such a conviction is the principle of Duty. Virtue consists in a perfect conformity and unison with self. Natural Law and Right, which Fichte was the first to treat as independent of Moral Right, instructs us as to the relations, in respect of Right, and the reciprocal actions of free-agents, and deduces them from self-consciousness, of which they are necessary conditions. Man cannot conceive himself to be a rational animal except inasmuch as he attributes to himself a power of Causality; nor can he suppose himself possessed of this, without extending the same to other beings, to all appearance like himself. Consequently, he conceives himself to be placed in certain relations of Right with regard to the latter, which induce him to regard his personal liberty as circumscribed by that of others. Fichte denies the existence of an Original Right, regarding it as a fiction created to meet the

<sup>m</sup> In his *Anweisung zum seligen Leben*, § 133, sqq., this view of morality is made superior to that presented by the principle of positive and imperative Legislation, at the same time that Fichte makes it subordinate to those of Religion and Science. According to his theory the only true life is the life in God, which gives birth to a higher principle of morality, lays open to us a new world, and creates it.

exigencies of Science. All Right has reference to some society or other, and derives its very existence from such a state. Rational beings are consequently intended to become at once members of society. A state is the realisation of Right as contemplated by Reason.—In his later account of political Right, Fichte chose to consider the realisation of the Kingdom of God upon earth as the true image of a state based on the principles of Reason; in other words a Theocracy, founded on the revelation of God in a human shape. It may be observed in general that his leading maxim is to make every thing subordinate to the idea of Reason: and on this principle he founded his plan for an universal national system of education, and a permanent school or college of learned men.

The *Religious philosophy* of Fichte has also attracted great attention. He represents the Deity as the immediate principle of morality, an idea to which *Ego* attains in consequence of feeling itself restricted in the exercise of its free-agency by the ideas of obligation. *Ego* labours to realise this idea of duty, and consequently to recognise a moral creation in the midst of the world without, which it has itself produced: in this manner it approximates the Deity, and attains to the life which proceeds from God. In this moral World Felicity is the result of moral worth. This felicity is not to be confounded with Happiness; which does not, and cannot exist: a doctrine which prohibits all reference to the latter as a final end. It is not necessary to think of the Deity as something distinct from the Moral World just described, notwithstanding our proneness to conceive of Him as a separate being, and the author of that creation. 1st. Because we cannot attribute to the Divinity the qualities of Intelligence or Personality, without making Him a finite being, like to ourselves. 2ndly. It is a species of profanation to conceive of the Deity as a separate essence, since such an idea implies the existence of a *sensible* being limited by Space and Time. 3rdly. We cannot impute to Him even existence without confound-

ing him with sensible natures. 4thly. No satisfactory explanation has yet been given of the manner in which the creation of the world could be operated by God. 5thly. The idea and expectation of Happiness is a delusion, and when we form our notions of the Deity in accordance with such imaginations, we do but worship the idol of our own passions—the Prince of this World.

Such extravagant or paradoxical rhapsodies<sup>a</sup> naturally procured for their author the reputation of Atheism, and drew upon him some persecutions not altogether undeserved; notwithstanding the display which he made of a profound sentiment of moral duty. He lived to renounce in some degree his heresies (see § 389)<sup>o</sup>.

*Remarks on the Scientific Theory at large.*

388. The system of Fichte is distinguished by a great appearance of logical accuracy and deduction. It solves many difficulties, but at the same time gives occasion to many new ones, and was exposed to the following objections. By the Kantists it was urged that 1st. Fichte had proposed for solution a grand philosophical problem, without previously inquiring whether it was capable of being solved. He pretends to explain every thing, but attempts this only by means of a seeming transcendental deduction, and is constantly driven back to gratuitous assertions and cyclical arguments. 2ndly. The principles laid down are those of Logic, which can never enable us to attain to an accurate knowledge of the nature and properties of any subject or object. It was farther urged

<sup>a</sup> See the work on the principle of our belief in a Divine Providence, mentioned in § 389 (notes). In his work on the Destiny of Man, p. 287, Fichte assumes the character of a mystical theist.

[<sup>o</sup> It is painful to be the instrument of putting on record so much of nonsense and so much of blasphemy as is contained in the pretended philosophy of Fichte: the statement, however, will not be without its good, if the reader be led to reflect on the monstrous absurdities which men will believe at the suggestion of their own fancies, who have rejected the plain evidences of Christianity. *Transl.*]

that these abstract elements had been artfully invested by him with the semblance of realities, particularly in the case of Principle the first, by the substitution of *Ego* for the Indeterminate Object. The non-Kantists objected: 1st. That this system converts *Ego* into an absolute and independent essence, annihilating the existence of external Nature, its independent reality, and its conformity to the laws of Reason. 2ndly. It is inconsistent with itself. *Ego* at first is represented as nothing but infinite activity, opposing to itself as a limitation *Non-Ego*, and thereby producing all things—space included. But in the first place; what is it which compels *Ego*, as yet unlimited and unrestrained, to circumscribe itself by the position of *Non-Ego*?—"Because otherwise it could not attain to a knowledge of objects." But what necessity can be shown for its aiming at the knowledge of objects, being itself infinite and unlimited? The pretended principle of the Activity of *Ego*, in virtue of which it establishes an *objective* world, is a primordial fact, of which we have no evidence from experience, and which can only be ascertained by intellectual contemplation, and is therefore a *postulate* arbitrarily, and, as it were, surreptitiously assumed for the purposes of the theory. Fichte confounds the operations of transcendental imagination in the construction of geometrical figures with the creation of determinate objects, without stopping to explain how the multiplicity of external objects and their various properties can possibly be effected by the construction of Form in Space. The postulate of an obstacle encountered by the infinite activity of *Ego*, which throws it back upon itself, and creates a consciousness of the necessity attaching to certain mental perceptions, is not to be accounted for either by the nature of *Ego* or *Non-Ego*. In short, instead of one mystery, this theory would establish another still more incomprehensible, all the time pretending to explain the former by the latter, and ending with an admission that its own principle of explanation is incomprehensible. Accordingly, in the most recent statement of his theory, the author is compelled to assert, (in

order to account for the feeling of *necessity* attached to certain mental perceptions, arising from their relation to an object), that *Ego* is restricted in the exercise of its energies by certain determinate limits, although he had described it as Infinite Activity and Independent Action. These limits or restrictions he is pleased to call incomprehensible and inexplicable, which nevertheless were precisely the object at which his Scientific Theory of Philosophy was levelled. His Idealism, therefore, is an example of speculation carried to the most extravagant excess, and ending in the destruction of itself; after having first annihilated all science and free-agency.

*Compare this transcendental Idealism with the supernatural Idealism of Berkeley, and the Realism of Spinoza.*

389. Fichte himself endeavoured to accommodate his theory to the opinions of others by subjecting it to various modifications<sup>p</sup>, particularly with reference to the

agreement he pretended to have established between it and the Critical method; as also with regard to the means of detecting in Consciousness the original activity of *Ego*. At first he attempted this on the principles of Thought, but subsequently had recourse to Intellectual Contemplation; (in his *Sonnenklarer Bericht*, mentioned below). The most remarkable difference however between the earlier and later editions of the Theory of Science, is this: that the first was composed on the principles of Idealism, the latter on those of Realism. The former sets out with asserting the unlimited and independent activity of *Ego*; the latter by maintaining the absolute existence of the Deity, as the only true reality—the only pure and self-existing life—of whom the world and consciousness are but the image and impress; treating objective nature as nothing more than a limitation of Divine Life. The philosophical system of Schelling appears to have contributed no less than the species of religious sentiment still retained by Fichte to effect this change.

The Scientific Theory excited a prodigious deal of attention and gained a great number of partisans, among others: *F. K. Forberg*, (see the catalogue of Fichte's works, No. 2); *F. J. Niethammer*, (born 1766); *K. L. Reinhold*, (see § 382); *Schelling*, (see following §); *J. B. Schad* (§ 395), afterwards a disciple of Schelling; *Abicht* (§ 396); *Mehmel*, and others<sup>a</sup>.

It also encountered many sturdy antagonists and severe critics, especially among the Kantists<sup>r</sup>. The end of it has been the same with that of all other exclusive theories, and in spite of its imposing tone of authority, which would elevate speculation at the expense of experimental knowledge (which it affects to contemn), it has failed to acquire an ascendancy in matters of philosophy. At the same time, it must be confessed that in its day it had

great influence over the minds of Fichte's contemporaries, and by the sort of eloquence which characterised his compositions, has promoted in many men a strong tendency to supra-sensual pursuits and investigations.

*Schelling's Theory of Absolute Identity.*

390. Fichte had attempted to construct a system of knowledge on the principles of Idealism, in respect both of Form and Matter; but Schelling carried Speculation a step farther, and instead of *Ego*, the Subject-Object, placed at the head of his system the Absolute Itself, and proposed to solve on philosophical principles the highest problem which Reason can contemplate—the nature of Absolute Being, and the manner in which all finite beings are derived from It. *F. W. J. von Schelling*<sup>\*</sup> is unquestionably an original thinker, superior to Fichte for the vivacity of his imagination,—the poetical character of his genius,—and the extent of his acquirements; more particularly in the history of ancient philosophy, in antiquities, and natural history. Having studied at Tübingen the systems of Kant, Reinhold, and Ænesidemus (Schulze), he accused the former of failing to deduce his conclusions from the first axioms of Science, and desiderated a common principle which might embrace alike the Speculative and Practical departments of knowledge<sup>†</sup>: objecting also to the use made of what was called the Moral Proof<sup>‡</sup>. Fichte's theory made a strong impression on his youthful and ardent temper, more inclined to adopt with readiness the imagination of the infinite and creative activity of the human mind, than disposed to a painful

<sup>\*</sup> An Aulic councillor, and at the present time a professor at Munich; born at Leonberg in Wurtemberg, Jan. 27, 1775.

<sup>†</sup> With these views he composed his first work: *Über die Möglichkeit einer Form der Philos. überhaupt*, Tübing. 1795; and, *Vom Ich als princip der Philos., oder über das Unbedingte im Menschlichen Wissen.*, *ibid.* 1806, 8vo, (see his *Philos. Works*, Vol. I).

<sup>‡</sup> See his † *Philosophical Letters on Dogmatism and Criticism*; first published in the *Journal of Niethammer*, 1796, and since incorporated in his works.

examination of the forms and laws by which that activity is circumscribed. With such views the young scholar resorted to Jena, where he formed a close intimacy with Fichte, and defended his theory against the partisans or the adversaries of Kant; without, however, adopting all its Dogmata. Gradually he dissented more and more from the system of his master, in proportion as he became more and more sensible of its defects.

391. Fichte had deduced all his system from the operations of *Ego* in what may be termed a *progressive* method; but without offering any proof for his leading assertion that the Subjective produces and creates the Objective; the latter never producing the Subjective. This process may be reversed and the argument conducted from Objective Nature to *Ego*; and if a due reference be not made to the Critical system the one method is no less admissible than the other. Spinoza had already produced a system of Dogmatism carried to the highest possible point, and ending in an objective Realism; and by such considerations Schelling was led to form the idea of two opposite and parallel philosophical Sciences—the *Transcendental Philosophy*, and the *Philosophy of Nature*, to the special treatment of which, especially the latter, he devoted various works. The former begins with the consideration of *Ego*, and derives from that the Objective, the Multifarious, the Necessary,—in short—the system of Nature. The latter sets out with the contemplation of Nature, and deduces therefrom *Ego*, the Unrestricted, and the Simple. The tendency of both is to illustrate by their mutual relations the powers of Nature and the Soul, considered as identical.

The principle which they have in common is this; The laws of Nature must exist within us as the laws of Consciousness; and *vice versâ* the laws of Consciousness are found to exist in objective Nature as the laws of Nature. It is to be observed, however, that the *first* of these two Sciences cannot investigate to the end the inexhaustible variety of external Nature; nor can the

*second* attain to a perception of the Simple and Absolute. It is impossible to explain to ourselves how out of Unity arises Multiplicity, and out of Multiplicity—Unity; (the last combining the twofold characters of Unity and Multiplicity). In this manner Schelling founded his system on the *Original Identity* of that which knows and that which is known, and was led to conclude the absolute identity of the Subjective and Objective, or the Indifference of the Differing; in which consists the essence of the Absolute:—that is, the Deity. The Absolute is recognised by an *absolute* act of cognition, in which the Subjective and Objective concur: in other words, by Intellectual Contemplation. Consequently Schelling opposes Absolute Cognition or Knowledge, obtained through the medium of the Ideas, to inferior or secondary knowledge, the result of Reflection by means of ordinary conceptions. The last description of knowledge is directed to things conditional, individual, and divisible, which are associated by a process of the understanding. The former contemplates the Absolute, which is independent and unconditional, and is apprehended by means of the Ideas. This is Science properly so called, and develops itself, (agreeable to its nature), as Unity, in an organic whole, in which the Subjective and Objective are indivisible and identical: a divine Science, embracing the highest sphere of Nature;—the only Science worthy of our serious regard, or of the name of Philosophy.

In this manner the system of Schelling proposes to attain to a knowledge of the essences and forms of all things, by means of the intellectual Ideas, and asserts that *to be* and *to know* are identical: (whence its appellation of the System of Absolute Identity—*Identitätslehre*). It is a transcendental and, according to Schelling, absolute system of Idealism, which would derive all knowledge not from the partial principle of *Ego*, but from one still higher—The Absolute; comprehending not only *Ego* but Nature also. It proposes to attain to a knowledge of the latter by means of the Ideas<sup>x</sup>, and labours

<sup>x</sup> The Philosophy of Nature, or the Construction of Nature *à priori*.

to establish a perpetual parallelism or analogy between the laws of Nature and those of Intelligence.

392. The Absolute is neither infinite nor finite ; neither to know nor to be ; neither Subject nor Object ; but that wherein all opposition of Subject and Object,—Knowledge and Existence,—Spirit and Inert Nature,—Ideal and Real,—together with all other differences and distinctions are absorbed and disappear, leaving an indissoluble and equal union of Knowledge and Existence. This Absolute Identity of Ideal and Real, and Absolute Indifference of the Differing (of Unity and Plurality), is the Unity which comprehends the Universe<sup>7</sup>. Absolute Identity *exists*, and out of its limits nothing really exists, and consequently nothing is finite which exists *per se*. All that *is* is Absolute Identity or a development of its essence. This development takes place in conformity with certain correlative Oppositions of terms, which are derived from Absolute Identity as the *poles* or *sides* of the same object, with a preponderance to the Ideal or Real ; and become identified by the law of *Totality* ; the principle of their development being that of *Identity in Triplicity*. Such development is sometimes styled a division of the Absolute ; sometimes a spontaneous revelation of the same ; sometimes a falling-off of the Ideas from the Deity. By such a revelation Absolute Knowledge is made possible to us ; Reason itself (as far as it is Absolute) being the identification of the Ideal and Real. The characteristic *form* of The Absolute is absolute knowledge, in which Identity and Unity assume the character of Duality, ( $A = A$ ). The leading propositions of this theory consequently are : 1. That there exists but *one* identical nature ; and that merely a quantitative (not a qualitative) difference exists between objects, *quoad essentiam*, resulting from the preponderance of the Objective or Subjective,—the Ideal or Real. The Finite has only an apparent existence, inasmuch as

<sup>7</sup> See Considerations on various Philosophical Principles, and particularly that of Schelling, in Fischhaber's Archis. f. Philos. I Heft.

it is the product of merely relative Reflection. 2. The One Absolute Nature reveals Itself in the eternal generation of existing things, which on their part constitute the *forms* of the first. Consequently each individual being is a revelation of Absolute Being, in a determinate form. Nothing can exist which does not participate in the Divine Being. Consequently the Natural world is not *dead*, but animated and divine, no less than the Ideal. 3. This revelation of the Absolute takes place in conformity with certain correlative Oppositions which characterise different gradations of development, with a preponderance of the Real or the Ideal; and which consequently are nothing more than so many expressions of Absolute Identity. Science investigates these Oppositions and presents a picture of the Universe, by deducing the Ideas of objects from the original contemplation of The Absolute, on the principle of Identity in Triplicity, (called by Schelling the process of Construction), in conformity with the creative process observable in Nature itself. This Ideal construction is what we call Philosophy, (the Science of Ideas); the highest effort of which is the perception of a *relative form* amid the multifariousness of external Nature, and the recognition, in this relative form, of *Absolute Identity*.

The scheme of such *Construction* is as follows :

- I. The Absolute—The Universe in its original form—The Deity : manifested in
- II. Nature, (the Absolute in its secondary form),

As Relative and Real,————As Relative and Ideal ;

According to the following gradations :

Weight—Matter	Truth—Science
Light—Motion	Goodness—Religion
Organic Structure—Life	Beauty—Art.

Above these gradations, (technically named by Schelling *Potenzen*), and independent of them, are arranged :

Man (as a Microcosm)	The State
The System of the World (the external Universe)	History.

393. Schelling believed himself to have discovered in the Ideas the essence of all things and their necessary forms; following the process of Intellectual Contemplation. He affected to amend the system of Kant, who had only recognised the existence of a knowledge of the phenomenal world, and allowed nothing more than belief for things existing *per se*; and thought he had refuted Fichte, who represents *Ego* as the only true Being, and all Nature as a dead and lifeless non-existence, incapable of any other characteristics than those belonging to a negation or limitation of *Ego*. Feeling confident that he had originated an ideal construction of the universe, not as it appears to us but as it really exists, he unfolded his views with great ability, without conforming himself to the subdivisions of Philosophy usually observed, and made a skilful use of his acquaintance with the theories of Plato, Bruno, and Spinoza. After having published several statements of his theory at large, he applied himself especially to one branch of it,—the application of its principles to real existence or the Philosophy of Nature, considered as the living principle which produces all things by subdivision of itself, according to the law of Duality. Of the Ideal Department of his system he treated only some separate questions, in his later writings on Free-will and the origin of Evil, the Nature of God, etc. etc.<sup>2</sup>. On the subject of *Morals* he delivers himself as follows: The knowledge of God is the first principle of all Morality. The existence of God necessarily implies that of a moral world. Virtue is a state of the soul in which it conforms itself not to an external law, but an internal necessity of its own nature. Morality is also Happiness. Happiness is not an accidental consequence of Virtue, but Virtue itself. The essence of Morality is the tendency of the soul to unite itself to God as the centre of all things. Social life, regulated according to the Divine Example with reference to Morality and

<sup>2</sup> In his, *Philosophy and Religion*, in his *Essay on Free-will*, in the *Letter to Eschenmayer* with reference to this treatise, and (*en passant*) in his controversies with Fichte and Jacobi.

Religion—Art and Science—is what we denominate a community, or the *State*. It is a harmony of necessity and free-will, with an external organisation. History, as a whole, is a revelation of the Deity, progressively developed. In his treatise on Free-will, Schelling went on to make a distinction between the Deity (simply so considered, or the Absolute), and the Deity *as existing*, or *revealing himself*, proceeding from a principle of existence contained in the Deity, (Nature in the Godhead), and thus attaining the condition of a complete essence, and assuming the character of personality, (*Deus implicitus explicitus*—see the following section). Every production of Nature contains in itself a double principle, viz. an obscure and a luminous one, which, to a certain extent, are identical. In mankind these constitute personality, the result of spirit and will, which have the power of separating themselves from the Universal Will which sways all Nature, by virtue of individual free-will. The consequence of this opposition of Individual to Universal Will, is the origin of evil; which becomes real only by virtue of such opposition. Schelling has treated the subject of Beauty merely with a reference to Art, defining it to be the Infinite represented in a finite shape, and describing Art as a representation of the Ideas, and a revelation of God to the human mind. This theory must be regarded as incomplete, (according to Schelling's own confession, Phil. Schr. I B.); its scientific development, as a whole, being conveyed to us only in a brief fragment<sup>a</sup>.

394. The theory of Schelling is remarkable for the originality of the views it contains, the magnitude of the problems it would solve, the consistency of its plan, and the vast circle of its application. It binds together by one single Idea all the essences of Nature, removing the limits which had been assigned by Kant to the dominion of Science, and asserting the possibility not only of a subjective apprehension, but of an objective and scientific knowledge—of a certain and determinate perception of God and Divine things, by virtue of the identity between the human mind and the essence of all Being. It embraces the whole circle of philosophical speculation, removing, as it does, the distinction between empirical and rational knowledge; and its principles are made applicable to all the sciences. It has the appearance however of being, 1st. As relates to Practical Science, very confined and embarrassed; nor can we discover how, in such a system of Absolute Identity, there can be room for

*practical necessity*, or, in other words, the obligation of duty<sup>b</sup>. The theory is characterised by a blind sort of *Natural Necessity* and Determinism:—God reveals himself of *necessity*:—All History, and all the mutations of the world are but the modifications of his essence<sup>c</sup>. 2ndly. Independently of this partial view of Nature, the system is deficient in the solidity of its principles. It is not shown in what manner the human mind can elevate itself to the intellectual contemplation described: the principles, therefore, laid down, are mere suppositions. *Thought* without a *Thinking Subject* is nothing better than an abstract idea:—Absolute Identity is inconceivable independent of Relative Identity. Without the latter, the former is reduced to a mere non-entity. It cannot be shown that Absolute Identity constitutes the essence of all beings: Objective Reality depends upon a confusion of the nature of Thought with the essence of external objects. To pretend that a pure abstraction like this is *real*, and constitutes the essence of all things, is a mere unfounded hypothesis, the proof advanced by Schelling being altogether untenable<sup>d</sup>: to support which he has recourse to a mere jumble of words, (“Identity of Identity and Non-Identity”),—to contradiction—(“The bond of Unity and Plurality—the Copula,—The Absolute in the Absolute,—The Divine in the Divine, etc.”), and to a multitude of vague and indefinite terms. 3rdly. This theory has only the *appearance* of a scientific system. The attempt to deduce the Finite from the Infinite and Absolute, and the Particular from the Universal, by means of a real demonstration, (construction), has proved abortive<sup>e</sup>. The author maintains that a Finite and Infinite, a Real and Ideal have co-existed from the beginning of things in an indissoluble union:

<sup>b</sup> See SCHELLING, Philos. und Relig. s. 53 u. f. Philos. Schriften, s. 413 u. f.

but anon he is obliged to suppose a separation between them, by virtue of his hypothesis of Absolute Identity. The same is the case with regard to self-revelation. The only answer he affords to the question, Why the Deity should reveal himself?—is a simple assertion that so it *must* be<sup>f</sup>. Occasionally he has recourse to Plato's mythical hypothesis of a Fall of the Ideas from the Absolute<sup>g</sup>; concerning which it may be queried how any thing can fall from the Absolute, which by hypothesis embraces and contains all things? Occasionally he labours to demonstrate that nothing exists besides Unity, the Copula, and the Absolute<sup>h</sup>: whence then are derived finite knowledge having reference to Space and Time; and the Categories? All that gives to his argument the appearance of successful demonstration is, that he has substituted for the vague idea of the Absolute certain fictions of the Imagination, and notions borrowed from experience. 4thly. Can any one presume to believe that the inscrutable nature of the Godhead is contained in the idea of Absolute Identity? His Natural Philosophy conveys to us no knowledge of God, and the little it reveals appears opposed to Religion<sup>i</sup>. It becomes a system of Pantheism by identifying the Deity with Nature<sup>k</sup>, and makes the Deity himself subject to superior laws, supposing him obliged to reveal himself, and making the Divinity as Intelligence proceed, within the compass of Time, from non-intelligent principles—Nature in the Deity and Chaos. The Deity is supposed to render passive a certain portion of his nature with which before he energised, and to enable us to conceive of him as a personal being, we are obliged to suppose the existence in him of Nature as a negative essence<sup>l</sup>. God is represented not only as a Divine Being, but as Life. Now

<sup>l</sup> Pages 96, 97.

life pre-supposes a certain destiny, and implies passive affections and a gradual development; and to such limitations we are taught to believe that the Deity has voluntarily submitted himself<sup>m</sup>. The whole theory is nothing better than an ingenious fiction, which, by offering the appearance of a solution of all difficulties, and by its pretended Construction of Nature, proved generally attractive; as well as by removing all idea of Constraint or Moral Obligation,—by suggesting a variety of new ideas,—and by appearing to throw open a wide perspective to the views of Science. As for the *manner* of Schelling, we are called upon to remark, besides the faults of a vague and indeterminate mode of expression already noticed, the employment of certain mythical and metaphorical terms, after the manner of Plato, which increase the difficulties belonging to his system<sup>n</sup>.

*Partisans and Adversaries of the System of Schelling.*

395. The enthusiasm which this system excited may be explained by a reference to the character of the theory itself, and of the times in which it appeared. A considerable school of disciples was formed among the moral philosophers, theologians, philologists, physicians, and naturalists of the day; who professed to investigate anew their several sciences on the principles of the system of Absolute Identity, and aspired to complete that system by fresh discoveries. The views of Schelling had a more especial influence on the sciences of Natural History, Mythology, History, and the Theory of Taste. The two *Schlegels* at one time contributed to extend its reputation by their labours in the last department. Others of this school were less commendable; and a dizzy spirit of exaggeration seemed to possess its professors, which led

them to accept as the highest efforts of wisdom the most extravagant and fantastical conceptions, and, by allying itself to superstition and enthusiasm, seemed to restore the days of Neoplatonism.

Among the *adversaries* of the system were several distinguished partisans of the theory of Kant, as well as the authors of certain new doctrines; such as *Herbart*, *Bouterwek*, and *Jacobi*, whom we shall have occasion to mention below. The opinions of Schelling were especially attacked by the theologians; who appear, however, occasionally to have understood them but imperfectly. Others, (for instance *Daub*), endeavoured to reconcile them with Religion.

### *Other Systems.*

396. *Fr. Bouterwek*<sup>a</sup>, an acute reasoner who had originally embraced and even given a new exposition of the theory of Kant, abjured the tenets of his master from a conviction that they were not proof against Scepticism, and professed himself dissatisfied with the partial character of Fichte's system. He maintained that Science demands the recognition of something Absolute, without which no knowledge nor even thought is possible, inasmuch as something real,—a Being,—the Absolute,—is pre-supposed in all demonstration. Accordingly he proceeded to demonstrate the inefficacy of former philosophical systems, alleging that they had attempted the discovery of Truth only by means of mental ideas and certain formularies, without ever arriving at real and animated Science. His leading principles were, that all Thought and Sensation are founded on some real ground,—the Absolute; which itself is dependent on nothing else. Such an essence is not discoverable by *Thought*, inasmuch as Thought pre-supposes its existence, as something superior to itself. Consequently, we are driven to conclude either that all Being is imaginary and all Thought without foundation, or that there exists an *ab-*

<sup>p</sup> NÜSSELEIN's *Lehrb. der Kunstwissenschaft*, Landshut, 1819, 8vo. *Grundlinien der allg. Psychologie*, etc., Mainz. 1821, 8vo. *d. Logik*. Bam. 1824, 8vo.

<sup>a</sup> Born 1766; died a professor at Göttingen, 1828.

*solute* faculty of knowledge, which neither *feels* nor *thinks*, constituting the fundamental principle of Reason itself and by virtue of which all Being is demonstrable. Subsequently Bouterwek retracted this doctrine, and adopted a new universal theory of Truth and Science, leading to a moderate system of Transcendental Rationalism, by means of the principle of the *Confidence of Reason in itself*. He defined the end of philosophy to be the solution of the enigma of nature and man, by distinguishing between the appearances and the realities of objects, as far as is attainable by unassisted human reason. This must be effected by a system of demonstration, in which empirical psychology and Logic (in the popular sense of the term), can contribute only the premises. This theory, like that of Jacobi (§ 398), supposes all merely logical thought to be *mediate*. All *immediate* knowledge (without which all *discursive* notions assume the character of *mediate*, and consequently become nugatory), is dependent on the original connection existing between the powers of Thought and the Internal Sense in the *Virtuality* of Spiritual life:—in the unity of the active properties of our nature, whether subjective or objective. Reason has confidence in herself in as far as she is *pure* Reason, and has confidence in truth as far as she recognises therein (by virtue of the connection just mentioned) her own independent energy; and discovers in this energy the germ of ideas, by means of which she can elevate herself above sensible impressions to the discussion of the original principle of all Existence and Thought, the idea of The Absolute. Consequently Truth, in the metaphysical sense of the word, (or the agreement of our conceptions with the *insensible* essences of things, and their necessary connection with the first principle of all Thought and Existence),—can be apprehended by reason *immediately*. Metaphysics (in connection with which comes Religious Philosophy founded on religious sentiment), completes the scientific development of this idea by instructing us *how far* a knowledge of the nature of things is possible to the human mind. Philo-

sophical Ethics and Natural Law are connected with the theoretical department of Philosophy by means of Universal Practical Philosophy.

The subject of Natural Right forms a special chapter in philosophical Ethics, in which Right is treated as a reasonable title, in virtue of which man, as a moral being, lays claims to all the external conditions appertaining to him, in all things relating to virtue and justice.

Bouterwek also laboured to establish a system of Æsthetics, on psychological principles, and independent, to a certain extent, of Moral Philosophy.

397. C. G. Bardili<sup>r</sup> endeavoured to make The Absolute the basis of a system on a new principle. He believed himself to have detected such an one in Thought, and sought to constitute Logic the source of real knowledge; elevating it to the rank of Metaphysics. Hobbes, and the physician Leidenfrost (in his *Confessio*, 1793), had already represented Thought as *calculation*, but Bardili was the first to imagine that he could discover

<sup>r</sup> Born at Blaubeuern, 1761; died at Stuttgard, 1808.

in Thought *per se* (contemplated under its *formal character*), a real existence; nay, even the essence of the Deity. The nature of Thought is such, that while it continues always the same it is capable of infinite repetition and multiplication. It is A *quatenus* A, in A:—*Identity*. Thought *quatenus* Thought is neither Subject nor Object, nor the relation of the one to the other; but their common elementary principle, in which the conceptions and judgments of the mind have their origin, being at the same time an *infinitivus determinans* and a *determinatum*. This principle of Thought, however, *determines* nothing until applied to something else, that is, to Matter; which is a necessary postulate of the system. The characteristics of Thought *quatenus* Thought, are Unity in Plurality:—*Identity*. The characteristics of Matter are Diversity and Multiplicity. Thought, the First and Absolute principle, is not determined by Matter, but *vice versâ* the last by it. The application of Thought to Matter produces: 1. Something real apprehended by the mind (B—Reality). 2. A mere conception of the mind (B—Possibility). The agreement of Thought with Matter constitutes Reality, which is only a more express determination of the Possible.

In many respects this obscure and fanciful system approached the theory of Leibnitz, representing the Deity as the *Monas Monadum*, or pure *Possibility*, which multiplies itself in all individual objects, and determines all thought,—the ultimate source of all truth, and consequently the fundamental principle of all Logic. Bardili styled his performance the Primary Logic, and announced its pretensions with considerable arrogance, but without much success<sup>a</sup>. The system of Rational Realism it was de-

<sup>a</sup> BARDILI'S Grundriss der ersten Logik, gereinigt von den Irrthümern der bisher. Logik, besonders der Kantischen, Stuttg. 1800, 8vo. Philosophische Elementarlehre. I Heft. Landsh. 1802; II Heft. 1806, 8vo. Beiträge zur Beurtheilung des gegenwärtigen Zustandes der Vernunftlehre, Landsh. 1803, 8vo.

At an earlier period Bardili had distinguished himself as an acute thinker by his: Epochen der vorzüglichsten Philosophischen Begriffe, I Th. Halle,

signed to support was no less unsuccessful, notwithstanding the subtle analysis of Reinhold (§ 382). About the same time many similar essays appeared, for the most part distinguished by little else but their obscurity and extravagance. Of this number was the *Archimetria* of the ingenious Swede, *Th. Thorild*<sup>†</sup>, which refers every thing to the theory of Magnitudes, containing many eccentric ideas, afterwards developed by others; and the *Epicritique* of *F. Berg*<sup>‡</sup>, who assumes as the key to the nature of all Reality,—“Logical Will;” and lastly, the “Altogether Practical Philosophy,” of *Rückert* and *Weiss*<sup>§</sup> (§ 399). The labours of *J. H. Abicht*<sup>¶</sup> are not more deserving of specification; consisting in a compilation of the works of others, in which nothing but the phraseology is his own.

## PHILOSOPHY OF SENTIMENT AND BELIEF.

### *Jacobi's Theory of Belief.*

398. A friend of Hamann (§ 369), *F. H. Jacobi*<sup>\*</sup>, advanced a theory totally at variance with the Critical and

<sup>\*</sup> Born at Düsseldorf, 1743; became in 1804 president of the Academy of Munich, and died 1819.

Dogmatical systems which then divided the philosophical world, and allied to the most exalted mysticism. He possessed an enlightened and religious mind, with considerable powers of expression and a sincere hatred of the empty formularies of system-makers. The last principle he carried so far as almost to show himself an enemy of philosophical reason itself, from a conviction that a consistent dogmatical theory, like that of Spinoza, which admitted no truth without demonstration, could conduct only to Determinism and Pantheism; while the Critical theory, by its prejudice in favour of demonstrative and mediate knowledge, was led to reject all perception of *insensible* objects, without being able to establish their reality by means of practical rational belief. He was thus led to found all philosophical knowledge on Belief; which he describes as an instinct of reason,—a sort of knowledge produced by an immediate sensation of the mind,—a direct recognition without proof of the True and *Insensible*; drawing at the same time a deep distinction between such Belief and that which is *positive*. The external world is revealed to us by means of the senses; but objects imperceptible to the senses, such as the Deity, — Providence, — Free-will, — Immortality, — and Morality are revealed to us by an *internal sense*, the organ of Truth; which assumes the title of reason as being the faculty adapted for the apprehension of Truth. This twofold revelation (of the material and the immaterial worlds), awakens man to self-consciousness, with a perception of his superiority to external Nature, or a sense of Free-will<sup>a</sup>. In the same manner Jacobi would found the principles of Morality on Sensation. Reason, as the faculty of the Ideas, which reveal themselves to the Internal Sense, supplies philosophy with its materials: the Understanding, or the faculty of Logical ideas, gives these a form. It is thus that he has expressed himself in his later works. He admits the great merit of Kant

<sup>a</sup> J. G. REICHZ, *Rationis, qua Fr. H. Jacobi e libertatis notione dei existentiam evincit, expositio et censura*, P. I. Götting. 1821, 8vo.

in destroying the vain labours of theorists, and establishing a pure system of practical philosophy, but differs from him by asserting that not only practical but also theoretical ideas, relative to real but insensible objects, are immediate ; and alleges that the Critical system annihilates not only rational apprehension but sensible perception. At the same time he maintains the impossibility of any true philosophical Science. Jacobi at first expressed himself somewhat obscurely on this principle of an internal revelation and consequent belief, the corner-stone of his system. In consequence of this obscurity arose a multitude of objections and misapprehensions, which were also provoked by his neglecting to discriminate accurately between Reason and Understanding ; and by the opposition between his Theistical theory of Belief and Sensation and the systems of his contemporaries ; as well as the want of systematic arrangement it betrayed. His countrymen however have not neglected to appreciate the indirect services which he has rendered to the cause of philosophy.

For Jacobi's writings on Spinoza, and in answer to Mendelssohn, see above, § 329 (bibl.).

Among his works were :

DAVID HUME, über den Glauben, oder Idealismus und Realismus, *Breslau*, 1787, 8vo. ; *Ulm*, 1795. Von den göttlichen Dingen, *Leipz.* 1811, 8vo. Sämmtliche Werke (containing also his celebrated philosophical romances), VI B. *Leipz.* 1812—1825, 8vo.

On Jacobi consult Schlegel's Charakteristiken und Kritiken, I B.

### *Further development of the Theory of Sentiment.*

399. The system of Jacobi found many adherents among men of minds similarly constituted ; but the want of precision observable in his distinctions respecting Understanding and Reason, appears to have given occasion to a sort of schism among his followers. One party looked upon the Ideas as a sort of revelation of the Di-

vine Nature, appropriate to Reason alone; alleging that the conceptions of the Understanding are incapable of leading us to an apprehension of the Ideas. They add that Belief precedes and comes before all knowledge. Another party attached more importance to the conceptions of the Understanding, and supposed philosophical science to be founded on the union of Reason and Understanding: its material and elementary part being derived from the former, and its formal characters from the last. Jacobi himself, at the close of his life, inclined to this opinion: the former was held by F. Köppen, an ingenious author and able expositor of the system he had adopted. *J. Salat* adhered to the latter.

The leading principle in the system of Köppen was that of Liberty, which he considers as a creative power, incomprehensible to the Understanding, the foundation of all existence, in short, *Being*, properly so called. Reason is the faculty by which it is apprehended. Necessity is a state of things established by Liberty.

The mode of reasoning adopted by Köppen would lead us to conclude the impossibility of any true philosophical knowledge. His writings, like those of Jacobi (whatever may be thought of his theory), have the merit of originality, and have been useful by opposing a new theory to the authority of the Dogmatists.

*Weiller*<sup>b</sup>, a friend of Jacobi, and *Weiss*<sup>c</sup> distinguished for his psychological researches, belong to this class.

Among the writings of Köppen were:

*Über Offenbarung in Beziehung auf Kant und Ficht. Philosophie, Hamb. 1797; second edition, 1804. Darstellung des Wesens der Philos., Nürnberg. 1810. Über den Zweck der Philosophie, München, 1807, 8vo. Verm. Schriften, 1806, etc., etc.*

<sup>b</sup> WEILLER (of Munich), see §§ 37 and 395. *Über die gegenw. und künft. Menschheit. Münch. und Papau. 1799. Anleit. zur freien Ansicht der Philos., Münch. 1804, 8vo. Verstand und Vernunft. ibid. 1806, 8vo. Grundlegung zur Psychologie, ibid. 1817, 8vo. etc.*

<sup>c</sup> WEISS, *Vom lebendigen Gott. und wie der Mensch zu ihm gelange, Leipz. 1812, 8vo.*

*Other Disciples of the same School.*

400. *J. Salat*, professor of Moral Philosophy at Landshut, made an *internal revelation* of the Divine Nature the foundation of his philosophical system. *F. A. Ancillon*<sup>d</sup> and *C. A. Clodius*<sup>e</sup> held in part the opinions of Jacobi, without properly belonging to his school.

Among the works of Salat were :

Über den Geist der Philos. mit krit. Blicken, etc., *Münch.* 1803, 8vo. Vernunft und Verstand., *Tüb.* 1808, II Thle. 8vo. Die Moralphilosophie, *Landsh.* 1810, 8vo.; third edition improved, *Landsh.* 1813-14, 2 vols. Socrates oder über den neuesten Gegensatz Zwischen Christenthum und Philos., *Sulzbach*, 1820, 8vo., etc., etc. An answer to the last appeared under the title of Über die Kunst Wort' und Nebel zu machen. Ein Supplement zu den Philos. Schriften, insbes. zu dem Socrates des HRN. SALAT, *Amberg*, 1821.

*Antidogmatism of Schulze.*

401. *G. E. Schulze* had exposed in his *Ænesidemus* the weak parts of the system of Reinhold (§ 382): he subsequently conceived a system of Scepticism which he qualified by a new appellation, that of Antidogmatism. He has more than once altered his views and definitions, and his latest opinions approximate in some respects those of Jacobi.

His works were :

Einige Bemerkungen über Kant's Philos. Religionslehre, *Kiel*, 1795, 8vo. Ueber den höchsten Zweck des Studiums d. Philos., *Leipz.* 1789, 8vo. Grundriss der Philos. Wissenschaften, 1788—90, II B. 8vo. *Ænesidem* (see § 382), Kritik der Theoretischen Philosophie, *Hamb.* 1801, II B. 8vo. Die Hauptmomente der Skeptischen Denkart über die menschliche Erkennt-

niss; in Bouterwek's Museum, III B. II Heft. Grundsätze der Allgemeinen Logik, *Helmst.* 1802, IV verb. Aufl. 1822. Leitfaden der Entwicklung, etc.

### *Herbart.*

402. *J. F. Herbart*, a professor at Königsberg, laboured to recal philosophy from the pursuit of psychological investigations, and proposed a system of Metaphysics which in some respects resembled that of the Eleatæ.

*Stiedenroth*<sup>f</sup> adopted certain of his opinions respecting the faculties of the soul.

Philosophical works of Herbart :

Ub. Philos. Studium, *Gött.* 1807, 8vo. Allgemeine prakt. Philosophie, *Gött.* 1808, 8vo. Hauptpuncte der Metaphysik, *Gött.* 1808, 8vo. Abhandlungen aus dem Gebiete der specul. Psychologie, im Königsb. Archiv. für Philosophie, *Königsb.* 1811-12. Bemerkungen ub. d. ersten Ursachen, welche das Einverständniss ub. d. ersten Gründe der prakt. Philos. erschweren, eine Abhandl. in den nachgelassenen philos. Schriften von Chr. Jac. Kraus, *Königsb.* 1812, 8vo. Theoriæ de attractione Elementorum Principia Metaphysica, sect. I, II, *Regiom.* 1812, 8vo. Lehrbuch z. Einleitung in die Philosophie, *Königsb.* 1813, 8vo.; II sehr verm. Ausg. *ebend.* 1821. Lehrb. zur Psychologie, *Königsb. u. Leipz.* 1816. Mathematik, II Thle., *ebend.* 1824, f. Allgemeine Metaphysik nebst den Anfängen d. Philos. Naturlehre. Erster Histor. krit. Theil. *Königsb.* 1828.

### *Schleiermacher.*

403. *F. Schleiermacher*<sup>s</sup>, a well-known theologian, employed himself in perfecting, with some originality, the

<sup>f</sup> ERNST. STIEDENROTH, Theorie des Wissens mit besonderer Rücksicht auf Skepticismus, etc., *Gött.* 1819, 8vo. Psychologie zur Erklär. d. Seelenerscheinungen, II Thle. *Königsb.* 1824-25.

<sup>s</sup> Professor of Theology at Berlin. Born at Breslaw, 1768.

departments of Moral Philosophy which bear upon the subjects of Ethics and Religion. In his works thus intended to combine philosophy with religion it will be thought by many that religion has lost much, without any thing being gained by philosophy. Schleiermacher has also distinguished himself by his *Kritik der Moral*<sup>h</sup>, and by some investigations relative to the History of Philosophy. His translation of Plato, enriched with introductory observations on each Dialogue, has been already noticed (§ 129, bibl.).

His philosophical works were :

SCHLEIERMACHER, *Über die Religion. Reden an die Gebildeten unter ihren Verächtern* (at first anonym.), *Berl.* 1799; III verm. Ausg. 1821, 8vo. *Monologen; eine Neujahrsgabe*, III Ausg. *Berl.* 1822, 8vo.

*Der Christliche Glaube nach den Grundsätzen der ev. Kirche im Zusammenhange dargestellt*, II B., *Berl.* 1821, 8vo.; II Ausg.

### *Systems allied to the Critical School.*

404. Two disciples of this school have distinguished themselves by their endeavours to illustrate and extend its doctrines: *Krug*<sup>i</sup>, by proposing them under the form of a new system which he denominates a *Transcendental Synthetism*; and *Fries*, by an attempt to render more complete the investigations of Kant by means of a new Criticism of Pure Reason. The system of Krug contains a new arrangement of the Metaphysical world, and appears to add little to that of Kant, except a superior degree of obscurity.

Several of Krug's works have been already quoted, to which may be added :

*Entwurf eines neuen Organons der Philosophie*, *Meissen*, 1801, 8vo. *Ueber die Methoden des Philosophirens u. die Systeme der Philosophie*, *ebend.* 1802, 8vo. *Fundamentalphilosophie*,

<sup>h</sup> Grundlinien einer Kritik der bisherig. Sittenlehre, *Berl.* 1803, 8vo.; (second edition?)

<sup>i</sup> W. TR. KRUG, born 1770; a professor at Leipsic.

*Züllich. u. Freyst.* 1803; III verb. Aufl. 1828, (his *chef-d'œuvre*). *System der Theoretischen Philosophie*, (I Th. Denklehre. II Erkenntnisslehre oder Metaphysik. III Geschmackslehre oder *Æsthetik.*), *Königsb.* 1806—10; III verb. Aufl. 1825, III Th. *System der prakt. Philos.* (I Rechtslehre. II Tugendlehre. III Religionslehre), *ebend.* 1817—19, (to be had also separately).

*Handbuch der Philosophie*, third edition, 1828.

### *Fries.*

405: *J. Fr. Fries* (born 1773, a professor at Jena), attempted an improvement of Moral Philosophy by means of *Philosophical Anthropology*, founding his system, as Kant had done, on investigations respecting the faculties of the human mind. He approached the opinions of Jacobi in those points on which he departed from the doctrines of Kant, of whose system he principally admired the practical department. His anthropological theories of Logic, Practical Philosophy, Ethics, and Religious Philosophy, contain many original ideas, too often expressed with little precision or regard to order.

His opinions were adopted and systematised by *F. Calker*<sup>k</sup>, with the addition of a new phraseology; and were applied to theology by *De Wette*, a professor at Basle.

Among the writings of Fries were, (besides some controversial works already referred to, § 389):

*System der Philosophie als evidente Wissenschaft*, *Leipz.* 1804, 8vo. *Philosophische Rechtslehre u. Kritik aller posit. Gesetzgebung*, *Jena*, 1804, 8vo. *Wissen, Glauben u. Ahnung.*, *Jen.* 1805. *Neue Kritik der Vernunft*, *Heidelb.* 1807, III B. 8vo.; II Aufl. 1828. *System der Logik*, *ebend.* 1811; II Aufl. 1819, 8vo. *Allgem. staatsrechtl. Ansichten*, 1816, 8vo. *Vertheidi-*

<sup>k</sup> A professor at Bonn, published: *Urgesetzlehre des Wahren, Guten u. I Th., *Halle*, 1824, 8vo. System der Metaphysik. Ein Handbuch für Lehrer u. zum Selbstgebrauch, *Heidelb.* 1824, 8vo.

*Systems originating in the Theory of Identity.*

406. C. A. Eschenmayer (a professor at Tübingen), proposed a system more mystical still than that of Schelling, to which on many points it was opposed; as was also the *Mathematical Philosophy* of J. Wagner (a professor at Würzburg), who in some respects approached the reveries of Lulli and Bruno. F. Krause (formerly a professor at Jena), in various publications, for the most part unfinished, has proposed some original ideas, differing from those of Schelling principally as relates to the nature of the Godhead. To these opinions he has added a new arrangement of the subject-matter of Moral Philosophy in general.

ESCHENMAYER's principal works :

Die Philosophie in ihrem Ubergange zur Nichtphilosophie, *Erlang.* 1803. Einleitung in die Natur und Geschichte, *Erl.* 1806, 8vo. Psychologie in drei Theilen, als empirische, reine u. angewandte, *Stuttg. u. Tüb.* 1817, 8vo.; II Aufl. 1822, *ebend.* Religionsphilosophie, I Th. Rationalismus, *Tüb.* 1818; II Th. ### *Most recent Philosophical Systems.*

407. It will be sufficient to enumerate here the most recent German metaphysicians, with their principal works.

*G. W. F. Hegel*<sup>1</sup> (a professor at Berlin), whose system is one of Absolute Idealism; *F. C. Weise*<sup>m</sup>; *W. Kern*<sup>n</sup>; *J. von Sinclair*<sup>o</sup>; *K. L. Vorpahl*<sup>p</sup>; *A. Kayssler*<sup>q</sup> (died 1822); and *D. T. A. Suabedissen*<sup>r</sup>; to whom must be added the names of *Grävell*, *Linkmaier*, *Schopenhauer*, *Von Berger*, *Tieftrunk* (of whom above, § 380), *Beneke*, *Keyserlingk*, *Gerlach*, *Sigwart*, *Hillebrand*, etc.<sup>s</sup>.

<sup>1</sup> *HEGEL's System der Wissenschaft. Erster Theil, die Phänomenologie des Geistes, Hamb. u. Würzb.* 1807, 8vo. *Wissenschaft der Logik, I u. II B. die objective, III B. die subjective* (mit bes. Titel: *Wiss. der subj. Logik oder die Lehre von Begriff*) enthaltend, *Nürnb.* 1812—16, 8vo. *Encyklopädie der Philosophischen Wissenschaften im Grundrisse, etc., Heidelb.* 1817, 8vo.; II Ausg. 1827. *Grundlinien der Philos. des Rechts (oder Naturrecht und Staatswiss. im Grundrisse), Berl.* 1821, 8vo.; (see also § 395).

<sup>m</sup> *WEISE, die Architektontik aller menschlichen Erkenntnisse nach ihren neuen Fundamenten, zu Gewinnung des Friedens in der Philos., Heidelb.* 1812, fol.; III vollendete A. *Heidelb.* 1815, fol.

<sup>n</sup> *KERN's Katharonologie, oder: Wie ist Reinmathematik möglich? Gött.* (1812), 8vo.

<sup>o</sup> *SINCLAIR's Wahrheit u. Gewissheit, Frcft.* 1811; III B. Versuch einer durch Metaphysik bedingten Physik., *Frcft.* 1813, 8vo.

<sup>p</sup> *VORPAHL's Versuche für die Vervollkommenung der Philos. Erster, zweiter u. dritter Vers., Berl.* 1811; und, *Philosophie oder Grundriss eines dynam. Lehrgebäudes derselben, Berl.* 1818, 8vo.

<sup>q</sup> *KAYSSLER's Grundsätze der theoret. u. prakt. Philosophie, als Leitfaden zu Vorles. Breslau u. Halle,* 1812, 8vo.

<sup>r</sup> *SUABEDISSEN's Betrachtung des Menschen, I u. II Bd. Betrachtung des geistigen Lebens des Menschen, Cassel,* 1815, III B.

<sup>s</sup> *GRÄVELL: Der Mensch. Eine Untersuchung für gebildete Leser, Berl.*

On the subject (connected with philosophical speculations) of Reason as applied to Revealed Religion, and of free-will as influenced by Divine Grace, it may be sufficient to refer to the publications of *Kähler*, *Schleiermacher*, *De Witte*, and *Bockhammer*<sup>1</sup>.

*Philosophical Writers of Great Britain.*

408. In Great Britain the principles of Locke have continued to preserve their influence, modified by the particular views of each of his disciples. Among the most eminent of these were *T. Brown*<sup>u</sup>, and *Dugald*

1815; III Aufl. 1819, 8vo. Der Bürger, eine weitere Untersuchung üb. d. Menschen, *ebend.* 1822. Der Werth der Mystik. Nachtrag zu Ewalds Briefen, etc. *Leipz.* 1822, 8vo. Der Regent, etc., II Thle., *Stuttg.* 1823.

LINKMAIER Lehrgebäude der allgem. Wahrheit nach der gesunden Vern., I Thl. Ontol. u. Kosmol., II Aufl., *Bielefeld*, 1821; II Thl., *Anthropol.* 1823.

SCHOPENHAUER: die Welt als Wille u. Vorstellung: vier Bücher, nebst einem Anhang, der die Kritik der Kantischen Philosophie enthält, *Leipz.* 1819, 8vo.

VON BERGER's Allgemeine Grundzüge der Wissenschaft, *Altona*, 1817—1827, 8vo. (I Th. Analyse des Erkenntnisvermögens. II Thl. zur Philos. Naturkenntnis. III Thl. Anthropologie, 8. IV Th. prakt. Philos.).

BENEKE's Erfahrungsseelenlehre, als Grundlage alles Wissens in ihren Hauptzügen dargestellt, *Berl.* 1820, 8vo. Erkenntnislehre nach dem Bewusstseyn der reinen Vernunft in ihren Grundzügen dargelegt, *Jena*, 1820, 8vo. De veris Philos. initiis, 1820, 8vo. Grundlegung zur Physik der Sitten, e. Gegenst. zu Kant's Grundl. der Metaph. d. S. mit e. Anh. üb. d. Wesen. u. d. Erkenntnisgränzen der Vern. *Berl. u. Posen*, 1822.

KEYSERLINGK, Entwurf einer vollst. Theorie der Anschauungsphilos. *Heidelb.* 1822, 8vo.

GERLACH, Grundriss der Fundamentalphilos. *Halle*, 1816, der Logik, *ebend.* 1817; II verb. Aufl. 1823; der Metaphysik, *ebend.* 1817; der Religionslehre, *ebend.* 1818, 8vo.

SIGWART, Handb. der theor. Philos., *Tüb.* 1820.

HILLEBRAND, Propädeutik der Philos. (I Abth. Encyklopädie. II S.) *Hdelb.* 1819. Grundriss d. Logik u. Phil. Vorkenntnislehre, *ebend.* 1820, 8vo. Die Anthropologie als Wissenschaft. III Thle. *Mainz*, 1822-23, 8vo.

<sup>1</sup> LUDW. AUG. KÄHLER's Supernaturalismus u. Rationalismus in ihrem Urspr., etc., *Leipz.* 1818. Die Abhandlungen SCHLEIERMACHER's u. d. WETTE's üb. d. Lehre von der Erwählung, etc. in d. theol. Zeitschr. derselb. I u. II Heft., *Berl.* 1819-20. GUST. FERD. BOCKSHAMMER die Freiheit des m. Willens, *Stuttg.* 1821, 8vo; and, Offenbarung u. Theologie, *ebend.* 1822.

<sup>u</sup> BROWN, Lectures on the Philosophy of the Human Mind.

*Stewart*<sup>x</sup>, recently dead, who assumes as the foundation of his Philosophy of the Human Mind, the phenomena of Consciousness. Speculative Philosophy has been altogether neglected by the English, and Practical treated principally with a reference to general Politics<sup>y</sup>.

The very name of Philosophy has received among them a private and improper signification, being applied to Political investigations, or to researches in Natural History. Their national pride has at all times inclined them to concern themselves little about the philosophical pursuits of other nations, and, with few exceptions, they have attempted nothing by the path of abstruse and painful research. In consequence, they continue to know little of the labours of the philosophers of Germany, and are very imperfectly acquainted even with the system of Kant<sup>z</sup>.

*Philosophers of France, Italy, and other countries.*

M. PH. DAMIRON, *Essai sur l'Hist. de la Philos. en France en XIX siècle.* Paris, II ed. 1828, 8vo.

409. The superficial philosophy of France preserved, from the time of Condillac, a constant direction towards Empiricism, which the ingenious theosophist and mystic *St. Martin*<sup>a</sup>, the disciple of *J. Böhm* and of *Martinez*

<sup>x</sup> DUGALD STEWART, *Elements of the Philosophy of the Human Mind*, second edition, *Edinb.* 1816, 8vo.; (the Supplement to the *Encyclopædia Britannica* contains a valuable review, written by him, of the progress of Metaphysical and Political Science). *Philosophical Essays*, second edition, *Edinb.* 1816.

<sup>y</sup> For instance: JOHN CRAIG, *Elements of Political Science*, *Edinb.* 1814, 3 vols. 8vo. JEREM. BENTHAM, various political publications.

<sup>z</sup> See, however, WIRGMAN, *Principles of the Kantesian or Transcendental Philosophy*, etc., *Lond.* 1824; and, *An Entire New, Complete, and Permanent Science of Philosophy*, founded on Kant's Critique of Pure Reason, *ibid.* 1824, 8vo. See also the works of NITSCH and WILlich, mentioned § 380, note.

<sup>a</sup> LOUIS CLAUDE SAINT-MARTIN, born at Amboise 1743, died 1804. *Des Erreurs et de la Vérité*, *Lyon*, 1775, 8vo. *Tableau Naturel des Rapports qui existent entre Dieu, l'Homme, et l'Univers*, 1782, 2 vols. 8vo. *De l'Esprit des Choses*, 1800, 2 vols. 8vo. etc.

*Pasqualis*, in vain endeavoured to counteract. The system of Gall and Spurzheim found a more easy acceptance. Of the metaphysicians of this period we may enumerate *Degerando*<sup>b</sup>, *St. Pierre*<sup>c</sup>, *Rapin*<sup>d</sup>, *Cabanis*<sup>e</sup>, and the *Comte Destutt de Tracy*, celebrated for his system of Ideology<sup>f</sup>. To these may be added *Laromiguière*<sup>g</sup>, *Azaïs*<sup>h</sup>, *Garat*, *Volney*, *Fabre D'Olivet*, and *Chateaubriand*; while to another school which opposed the principles of theology to those of materialism, belonged the *Comte J. Demaistre*, *De la Mennais*, *Bonald*, etc.

The Kantian system had been made known to his countrymen by *C. Villers*, (§ 380, note<sup>p</sup>), and excited a degree of attention which from feeble beginnings has gradually acquired more and more strength under the patronage of the celebrated translator of Plato, and editor of Proclus, *Victor Cousin*<sup>i</sup>; whose researches set out with the "Interrogation meditative de la Conscience." To the same party belong *Berard*, *Virey*, *Maine de Biran*, *Roger Collard*, *Jouffroy Keratry*, *B. Massias*<sup>k</sup>, *Droz*<sup>l</sup>, and the Swiss philosopher *Bonstet-*

An Italian Translation of his *Metaphysics* by MONTI, *Milan*, 1816. *De uno universi Juris Principio et fine uno*, *Neapol.* 1720, 4to. *Liber alter qui est de Constantiâ Jurisprudentiæ, ibid.* 1721. His principal work was: *Principi della Scienza nuova d'Intorno alla Commune natura delle Nazioni*, *Nap.* 1725, second edition, 1730; third, entirely remodelled, *Nap.* 1744, 8vo., and following years: the seventh edition by GALOTTI, (*Nap.* 1817,) is a reprint of the first.

<sup>p</sup> Born, 1712; died 1769.

<sup>q</sup> The following works have however appeared:

ERMENEGILDO PINO, *Protologia analysin Scientiæ sistens ratione primâ exhibitam*, vol. I—III, *Mediol.* 1803, 8vo.

CÆSARIS BALDINOTTI *Tentaminum Metaphysicorum*, lib. III, *Patar.* 1817, 8vo.

<sup>r</sup> GAETANO FILANGIERI, born at Naples, 1752; died 1788. *La Scienza della Legislazione*, 8 vols. *Nap.* 1780, 8vo. (various editions).

<sup>s</sup> CÆSARE BONESADO, marchese di Beccaria, died 1793: *Dei delitti et delle pene*, *Nap.* 1764, 8vo.

<sup>t</sup> The *Ideology* of Destutt de Tracy has been translated (*Milan*, 1817): See also a *Collezione di Classici*, *Pavia*, 1819—22.

<sup>u</sup> SACCHI, of Pavia, has translated the works of Kant; and PASQUALI GALAPPI has published *Saggio Filosofico sulla Critica della Conoscenza*, *Napoli*, 1819, 8vo.; and *Elementi de Filosofia*, V tomi, *Messina*, 1821—27,

The work of *Appiano Buonafede* on the History of Philosophy has been already mentioned (§ 37, *d.*).

In Holland, Sweden<sup>2</sup>, and Denmark, we meet occasionally with instances of a capacity for philosophical pursuits, but rarely with traces of the originality of the German school. Among the Dutch the system of Kant found, as we have had occasion to show (§ 380) many supporters. Political circumstances, no less than the dissensions existing in the school of that philosopher, appear to have impeded its progress in that country. Among those who cultivated German philosophy and adopted one or other of its systems, may be enumerated *Van Hemert*, *D. Wytttenbach*, and *F. Hemsterhuis*<sup>3</sup>.

The other continental nations of Eastern Europe have become acquainted with German philosophy, principally in consequence of the residence of their youth at the universities of that country<sup>4</sup>. A knowledge of the same appears by this time to have penetrated even to the Brazils<sup>5</sup>.

8vo. On *Æsthetics*: GIOV. B. TALIA, *Saggio di Estetica*. *Venezia*, 1822, 8vo. To which may be added a translation of A. W. SCHLEGEL's *Lectures on the Drama*, by GEMINIANI.

\* Prof. SAM. GRABBE, *Animadversiones in Constructionem Materię Schellingianam*, part I, *Upsal*. 1818, 4to. Prof. NIC. FR. BIBERG, *Notionum Ethicarum, quas formales dicunt, dialexis critica*, P. I, *Upsal*. 1823, 4to.

† D. WYTTENBACH, died 1820. See § 380, notes, towards the end. He also wrote *Præcepta Philosophiæ Logicæ*, (applied to the Classics), edited by EBERHARD, *Halle*, 1784, and *Maas*, 1820, 8vo.

F. HEMSTERHUIS, born 1720; died 1790. *Sophyle, ou de la Philosophie*. — *Aristée, ou de la Divinité*. See his *Philosophical Works*, *Paris*, 1792, 8vo. (French); second edition, *ibid.* 1809, 2 vols. 8vo.

<sup>2</sup> SIGISM. CARLOWSKY, *Logic*, *Kaschau*, 1819.

J. E. JANKOWSKY, (a professor at Cracow), *Logic*, (in Polish), 1822. For the philosophical labours of the Poles see the *Gött. gel. Anz.* St. 205, 1822.

J. GOLUCHOWSKY (a partisan of Schelling's theory) *Die Philosophie in ihrem Verhältniss zu dem Leben ganzer Völker*, etc., *Erlang.* 1822, 8vo.

See (Russia) *Essais Philosophiques sur l'Homme, ses Principaux Rapports et sa Destinée*, etc., par L. H. DE JACOB, *Halle*, 1818, 2 vols. nouv. édit. augmentée, *Pétersbourg*, 1822.

<sup>5</sup> The Critical Philosophy is now taught there in the college of St. Paul's. See Zschocke's *wöchentl. Unterhaltungsblätter*, *Aarau*, 1824, St. 3.

*Conclusion.*

410. The vast variety of contradictory attempts destructive of each other, to which the spirit of philosophical research has in modern times given birth, may appear to throw suspicion on the cause itself, and to discourage the very idea of the possibility of a satisfactory solution of the problems proposed, by the discovery of a theory of knowledge, based on firm and immutable principles. The Critical system itself has failed to check, as it undertook to do, the daring flight of Speculation, or to disarm Scepticism ; and has had the effect of affording them renewed strength and more lofty pretensions. Nevertheless these discordant essays ought to inspire us with the hope that sooner or later Reason will attain to complete self-knowledge ; that she will be enabled to detect, by gradual advances, the true method of philosophical research, and be taught by the experience of past ages to avoid the shoals and rocks on which so many adventurous thinkers have been stranded.

Possibly a time may come when those very modes of thinking which now appear to us deviations from the true path, may be discovered to have been nothing but the necessary steps of Reason in her gradual progress to true cultivation and genuine wisdom.

**CHRONOLOGICAL TABLE**

**FOR**

**THE HISTORY OF PHILOSOPHY**

**FROM THE TIME OF THALES.**

B. C.	Rome	Olymp.	
640	114	35,1	Thales born, ac. to Apollodorus.
630	116	35,3	Solon born.
629	125	38	Thales born, ac to Meiners.
611	143	42,2	Anaximander born.
608	146	43,1	Pythagoras born, ac. to Larcher.
598	156	45,3	Solon published his laws. Pherecydes born about the same time.
597	157	45,4	Thales foretold an eclipse.
584	170	49	Pythagoras born, ac. to Meiners.
561	193	55,1	Solon died.
557	197	56	Anaximenes flourished.
548	206	58,1	Thales died.
547	207	58,2	Anaximander died.
543	211	57,2	Thales died, ac. to some. Pherecydes died.
540	214	60	Pythagoras founded a school at Croto.
536	218	61	Xenophanes settled at Elea.
504	250	69	Pythagoras died. Parmenides flourished, ac. to some.
500	254	70,1	Anaxagoras and Philolaus born. Heraclitus and Leucippus flourished. Anaximenes died.
496	258	71,1	Ocellus Lucanus flourished.
494	260	71,3	Democritus born.
490	264	72,3	Battle of Marathon.
489	265	72,4	Pythagoras died, ac. to some.
480	274	75,1	Battle of Salamis.
472	282	77	Diogenes of Apollonia flourished.
470	284	77,3	Democritus born, ac. to Thrasyllus.
469	285	77,4	Socrates born. Parmenides flourished.
460	284	80	Parmenides came from Elea to Athens with Zeno. Democritus born, ac. to Apollodorus. Empedocles flourished, ac. to some.

B. C. <i>Rome</i> O'lymp.			
456	298	81	Anaxagoras repaired to Athens.
450	304	82,3	Xenophon born.
444	310	84	Melissus.
			Gorgias wrote his treatise <i>Περὶ Φύσεως</i> .
442	312	86	Protagoras and Prodicus flourished.
432	322	87,1	Beginning of the Peloponnesian war.
431	323	87,2	Anaxagoras accused.
430	324	87,3	Plato born, ac. to Corsini.
429	325	87,4	Plato born, ac. to Dodwell. Pericles died.
428	326	88,1	Anaxagoras died.
427	327	88,2	Gorgias sent ambassador to Athens. Diagoras flourished.
414	340	91,3	Diogenes of Sinope born.
407	347	93,2	Democritus died, ac to Eusebius.
404	350	94,1	Close of the Peloponnesian war.
400	354	95,1	Socrates died; his disciples retired to Megara.
			Euclid and Archytas flourished.
389	365	97,4	Plato's first voyage to Syracuse.
384	370	99,1	Aristotle born. Pyrrho born.
380	374	100	Antisthenes and Aristippus flourished.
		102	Aristotle repaired to Athens.
			Eudoxus flourished.
364	390	104,1	Plato's second voyage to Syracuse.
361	393	104,4	Plato's third voyage to Syracuse.
360	394	105	Xenophon died.
356	398	106	Alexander born.
348	406	108,1	Plato died; Speusippus succeeded him.
343	411	109,2	Aristotle became preceptor to Alexander.
340	414	110,1	Diogenes and Crates (the Cynics) Pyrrho and Anaxarchus flourished. Zeno of Cittium born.
339	415	110,2	Speusippus died. Xenocrates began to teach.
337	417	110,4	Battle of Chæronea. Epicurus born.
336	418	111,1	Philip, king of Macedon, died.
335	419	111,2	Aristotle opened his school at the Lycæum.
324	430	114,1	Diogenes the Cynic died.
323	431	114,2	Alexander the Great died. Ptolemey, the son of Lagos, succeeded him in Egypt.
322	432	114,3	Aristotle died; Theophrastus succeeded him.
320	434	115	Demetrius Phalereus, and Dicæarchus of Messana flourished.
316	438	116,1	Arcesilaus born, (or later).
314	440	116,3	Xenocrates died; Polemo succeeded him.
313	441	116,4	Theophrastus became celebrated. Crates.
305	449	118,3	Epicurus opened his school at Athens.
300	454	120,1	Stilpo and Theodorus, the atheist, flourished.
			Zeno founded a school at Athens.
			Diodorus and Philo.

B. C.	Rome	Olymp.	
288	466	123,1	Pyrrho died.
286	468	123,3	Theophrastus died. Pyrrho died about the same time; succeeded by Strato.
285	469	123,4	Ptolemæus Philadelphi became king of Egypt.
280	474	125,1	Chrysippus born.
272	482	126,4	Timon flourished.
270	484	127,2	Epicurus died.
269	485	127,3	Strato died; succeeded by Lyco.
264	490	128,3	Zeno, the Stoic, died (or later); succeeded by Cleanthes.
260	484	130	Persæus.—Aristo of Chios.—Herillus flourished.
241	513	134,1	Arcesilaus died (or later).
217	537	141,3	Carneades born.
212	542	143	Zeno of Tarsus flourished.
208	546	144	Chrysippus died, ac. to Menage. Diogenes of Babylon.
185	569	148,4	Panætius born (ac. to some later).
155	599	156,3	Embassy from the Athenians to Rome. (Crito- laus, Carneades the Stoic, and Diogenes of Babylon).
146	608	158,3	Greece and Carthage subjected to Rome. Antipater of Tarsus.
142	612	159,3	Macedon became a Roman province.
135	619	161,2	Posidonius born.
129	625	162,4	Carneades died; succeeded by Clitomachus.
115	639		Panætius accompanied Scipio Africanus to Alex- andria.
107 or 106	647	167,2	Cicero born.
		170	Clitomachus died; succeeded by Philo. Posido- nius flourished.
84	666	171,1	Sylla took Athens. Philo retired to Rome. Antiochus.
86	667	171,2	Lucretius born (ac. to others earlier). Posido- nius died.
69	685	178	Antiochus died.
63	691	172,2	Judæa became a Roman province.
50		182,2	Posidonius died; succeeded by Jason. Lucretius died.
48		183,1	Cratippus, the Peripatetic, flourished.
44 or 43	711	184,2	Cicero died.
30	724	187,3	Egypt became a Roman province.
27	727	188,2	Augustus became Emperor. Philo, the Jew, born.

A. C.	Roman Emperors.	
1	Augustus.	Birth of J. C.
3		Seneca the philosopher born.
		Sextius the Pythagorean.
		Nicolaus of Damascus, and Xenarchus flourished.
		Athenodorus the Stoic.
14	Tiberius.	
15		Sotion.
33		Crucifixion of J. C.
34		Philo the Jew flourished.
37	Caligula.	Flav. Josephus born
41	Claudius.	
50		Plutarch of Chæronea born.
54	Nero.	
65		Seneca died.
66		Cornutus and Musonius exiled.
69	Gal. Otho.	
	Vitellius.	Apollonius of Tyana flourished.
79	Titus.	
81		Musonius Rufus recalled from exile.
82	Domitian.	Domitian banished the philosophers and mathematicians from Rome.
89		Justin Martyr born.
		Epictetus flourished.
90		Apollonius of Tyana died.
95		
97	Nerva.	Plutarch flourished.
99	Trajan.	Tacitus.
		Gnostics.
118	Adrian.	Secundus of Athens. Plutarch died.
120		
122		Euphrates the Stoic died.
131		Galen born. Favorinus. Basilides the Gnostic.
134		Arrian flourished.
138		Akibha the Rabbin died.
139	Antoninus Pius.	Calv. Taurus. Apollonius the Stoic.
		Basilides the Stoic.
160		Apuleius.
161	M. Aurelius Antoninus.	Alcinous. Numenius.
165		Peregrinus the Cynic, and Justin Martyr died.
		Lucian.
170		Athenagorus and Tatianus. Atticus the Platonist.
		Bardesanes.

A. C.	Roman Emperors.	
180	Commodus.	Maximus of Tyre. Death of Antoninus. Irenæus. Juda the Rabbi. The Talmud.
185		Origen born.
193	Pertinax.	Ammonius Saccas founded a school.
	Julianus.	Clemens of Alexandria. Alexander of Aphrodisias.
	Sept. Severus.	Galen died.
200		Plotinus born. Philostratus.
205		
212	Caracalla.	Clemens of Alexandria died.
218	Macrinus.	Tertullian died.
220	Antoninus Helio- gabalus.	
222	Alex. Severus.	
232		Plotinus became a disciple of Ammonius.
233		Porphyrus born.
235	Maximinus.	
238	Gordian.	Ulpianus.
239	Gordian the son.	
242		Plotinus travelled into Persia.
243		Plotinus came to Rome.
244	Philip.	
246		Amelius became a disciple of Plotinus.
253	Trajanus Decius.	
252	Trebonianus. Gallus and Vibius Hostilianus.	
252		Longinus flourished.
253	Æmilius Valeri- anus.	Origen died.
269	Flavius Claudius.	
270	Aurelian.	Plotinus died.
275		Longinus put to death.
276	Flavius Tacitus.	
277	Aurel. Probus	Manichæans.
282	Aurelius Carus.	
284	Diocletian.	Arnobius.
304	Constantine and Maximianus.	Porphyrus died.
306	Constantine the Great.	
321	Constantine con- verted to Chris- tianity.	Jamblichus flourished.
326		Arnobius died.
330		Lactantius died.

A. C.	Roman Emperors.	
333		Jamblichus died. Themistius.
337	Constantius and Constans.	
340		Eusebius bishop of Cæsarea died.
354		Augustine born.
355		Themistius taught at Constantinople.
360	Julian.	Sallustius.
363	Jovianus.	
364	Valentinianus and Valens.	
379	Theodosius the Great.	Eunapius.
380		Nemesius flourished.
384		St. Jerome fl.
391		Gregorius of Nazianzus died.
394		Gregorius of Nyssa.
395	Arcadius and Ho- nori.	The Roman empire divided.
398		St. Ambrosius died.
400		Nemesius died.
401		Plutarch the son of Nestorius flourished.
	<i>Greek Emperors.</i>	
402	Arcadius.	
408	Theodosius II.	
409		Macrobius,—Pelagius.
410		Synesius.
412		Proclus born.
415		Death of Hypatia.
418		Pelagius condemned.
430		St. Augustine, and Plutarch the son of Nestorius, died.
434		Syrianus flourished.
450	Marcianus.	Hierocles and Olympiodorus flourished. Syrianus died.
457	Leo I.	
470		Claudianus Mamertinus flourished. Boe- thius born.
474	Leo II. Zeno Isauricus.	Marcianus Capella flourished.
476	<i>End of the West- ern Empire.</i>	
480		Salvianus.—Cassiodorus born.
485		Proclus died.—Ammonius the son of Hermias.—Hierocles.
487		Æneas of Gaza flourished.
490		Marinus died.

A. C.	Greek Emperors.	
491	Anastasius.	Marinus succeeded by Isidorus.
518	Justin I.	
526		Boethius beheaded.
527	Justinian.	
529		The Schools of philosophy closed at Athens.
533		Philoponus flourished.
539		Cassiodorus retired to a convent.
549		Damascius and Simplicius flourished.
563	Justinian II.	
575	Tiberius II.	Cassiodorus died.
582	Mauritius.	
602	Phocas.	
604		Gregory the Great died.
610	Heraclius.	
622		Flight of Mahomet.
636		Isidorus of Seville died.
641	Constantine III. and IV.	
	Constans II.	
668	Constantine V.	
673		The Venerable Bede born.
685	Justinus II.	
694	Leontius.	
698	Tiberius III.	
711	Philippicus.	
713	Anastasius II.	
716	Theodosius III.	
717	Leo III. Isauricus.
